which is considered beneficial. Many volunteers have scanners or
other receivers for listening to our transmissions. In addition,
members of the public, especially in smaller communities rely on
monitoring fire traffic to keep up with any emergencies in their
area. As a result, it is well known that the radio is not the place
to transmit confidential information, and that telephone or other
means should be used for this purpose.

5951. How do i scan the service searches and weather?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-10-28 07:15:53 UTC
From: Jerry Mader
Topic: 5951 Message: 5951

Hey there.
How can i scan the weather and use the weather alert properties and scan the various service searches on the scanner itself.
What keys do i have to press?
thanks so much.
Jerry Mader

I would like to purchase another 396T or perhaps even a 396XT. I have a 396T that is set up for home use but would like another one for on-the-go.

I don't really need any of the accessories except for maybe a spare AC Adapter, but depending on the price I will consider whatever combo of radio and accessories you may have.

Regarding "Condition" -- I don't mind if cosmetically it's a little marred up, including perhaps some light scratches on the screen, but I do want a 396T or 396XT that is fully functional.

Thanks.

I'll try to attempt to walk you through the steps. It wont be easy for a blind person.
Press Menu and scroll 3 clicks to "Search For", enter or press down on scroll knob to reach Service Search.
First Service Search is Public Safety. Enter or press down on scroll know to enter Public Safety search.

Upon reaching the "Service Search" mode, one click of the scroll knob would have placed you in the "News" search.
Two clicks to "Ham Radio"
Three clicks to "Marine"
Four clicks to "Railroad"
Five clicks to "Air"
Six clicks to "CB Radio"
Seven Clicks to "FRS/GMRS/MURS"
Eight clicks to "Racing"
Nine clicks to "FM Broadcast"
Ten clicks to "Military Air"
Eleven clicks to "Special". I don't know what Special is.

This is the best I can do with describing the key presses for Service Search.
I hope all this assists you with enjoying this great scanner.

Joe, you are correct, looks like we will get an "Australianized" version of 396 called the UBCD396XT due out before Christmas (2011), I believe the only difference is that the upper part of the 800MHz trunk band will be "unblocked" for the land down under, although it's been mentioned that it *may* have a couple of new features over the US version, but I'll believe that when I actually see it?

No word yet on a UBCD996XT mobile version?

BTW, Uniden Australia have been out of the scanner business for years, they discontinued the old UBCD396T/996T's and any support thereof quite some time ago.

They were retailing those old scanners for $999 when you could buy the newer model out of the US for about half the price, little wonder they weren't selling!

There also seems to be some feelings among the Australian scanner community that Uniden Australia won't be back in the scanner market long enough to provide ongoing support for this model either (you can NOT use the US firmware in these models) so many are saying they won't be buying the Aussie version anyway?

Andrew

5967. FREESCAN "locked" file

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-02 01:53:04 UTC
From: V. Singh, MBA, RPhT
Topic: 5967 Message: 5967

I am trying to upload my Freescan programming to myself via gmail. However, gmail is not allowing me to attach it. It looks like the "lock" that is on the file is the problem since the only files I can see are the 2 that don't have this lock icon. How do I get rid of this lock? Please advise.

Thanks,
Singh, AJ4VS

Not sure it has anything to do with the file. GMAIL likely does not like
the extension. Try zipping the file and attach it to your email, then
unzip it once you retrieve it.

Try closing out FreeScan, and then rename the extension of the file to .123

From: Jerry Mader
Topic: 5975 Message: 5975

Hey there folks.
DO i have to buy the cable separate or is there one included with the scanner?
I just wondered about that.

If Gmail is blocking the upload because of the extension, try changing the extension so that it can be sent. Then change it back when received.

From: V. Singh, MBA, RPhT
Topic: 5967 Message: 5978

I researched the file itself further via the explorer. Turns out the file was not actually in the folder I was looking for it, but Win7 "appeared to have" placed it there when I accessed it via FreeScan because of the similar *.996 file extension.

As it turns out, the file was ACTUALLY in my wirelessly networked drive in my den and I was accessing it through another PC. When I realized that, it was a simple matter of copying the file from the networked drive to the local machine to allow full access.

The 9 pin serial cable is included in the box. If you need the USB-1 adapter cable you need to buy it separately.

Topic: 5958 Message: 5983

Agreed. I imported my 396XT, but a friend told me 6 months ago that Uniden were planning to start bringing the XT into Australia. Digital scanners weren't really popular in Australia because the police P25 transmissions are all encrypted. Now, the NSW government is switching to a P25 Government Radio Network, digital transmissions are getting more popular and there is a demand for a quality digital scanner.

Although this belongs up on FreeScan group, here's a screen shot of one of my trunked systems. Notice the ID's on the left. Now look right, there is an option to set an Alert Tone,
Level, Color, Pattern...

Hope this helps...PS: Never tried on Trunk System...

5989. Clarification for RID's

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-02 20:04:59 UTC
From: Lance
Topic: 5979 Message: 5989

I have set color on ID's on a trunk system, never had a need to create an Alert tone.

There is another place in FreeScan to do this, again have not tried it...

This is from your setup window for a trunk system you have created...

Look at the bottom of this screenshot, Notice the box that says, XT Options, look at the settings from within there...

I'm doing this by hand w/out FreeScan, so I'm sure it still qualifies for
this group :-)

However, I read a LOT on RR.com today and found verification...

This feature is NOT supported with RIDS. TGID could be linked to alerts,
but these alerts will not work with RIDS. The RIDs/UIDs are only for
alpha-tagging purposes. Oh well...I guess we can't have it all :-(

>to a P25 Government Radio Network, digital transmissions are getting
>more popular and there is a demand for a quality digital scanner.

I also imported my 396XT, and I agree, there will be a market for P25
scanners in Australia in the not too distant future. In Victoria,
the CFA will be one of the drawcards for P25 listeners, when their
radio network goes P25 in the next few years.

From: Scanner
Topic: 5994 Message: 5994

I want to order the rubber bumper and cover, mainly the data port cover. I called Uniden and was told that these parts cannot be ordered.
Does anyone know where to order replacement rubber ??

I also want to order the belt clip.
black belt clip BCH396T is $5.00
blue belt clit BCKHHR is $2.49

The Blue clip looks the same but can anyone tell me if it's the same size.

I never saw a blue one for the scanners. Maybe it was for the Radio
Shack model that was blue.

As for the rubber, it may come as part of the case, so you may have to
order the case to get it.

Mine don't i managed to accidentally snap that tab off of my clip.
Now it removes with eas. Stays on too but they only problem is, if I move the scanner to swiveled it it will come off.
duh right? So now I'm wondering is there a place to get a new clip if i wanna buy one?
Thanks

6000. RE: [BCD396XT] trunking an ltr system need help.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-06 17:00:22 UTC
From: Jerry Mader
Topic: 5910 Message: 6000

Hey if i hear a frequency with a LTR burst how do i figure out which lcn it is if i don't know the rest of the numbers?
Can i just set it to ltr and let the scanner scan and then it will still trunk it or won't it trunk at all?
I think this is the home freq i hear a lot of people on it it's a security channel for a hospital near by.

To: BCD396XT@yahoogroups.com
Subject: Re: [BCD396XT] trunking an ltr system need help.

First, you have to find out if it exists. (do that as I mentioned)

Next, you will have to determine the LCN. Without any outside help, about the only way to do that on a 396XT is to program a new LTR system and put the same frequency in with each LCN. The channel that becomes active will tell you the correct LCN for that frequency. Or, you can look at the TGIDs. Most, if not all, the ones you see will likely be the correct LCN for that channel (again, using the 0-03-xxx example - I forgot the 'area code' before. That's the leading 0- at the beginning).

Yes i did.
How can i tell if it's actually trunking it.
I can't see so is there a way to tell?
I could control it via free scan if need be that seems to output the ID's to a log.
I haven't tried that yet.
controlling it with this system on it yet i mean.

Is there anyway for you to know if the Talkgroups are displayed ? If so,
its trunking. If all or most of the Talkgroups have the same
Home Repeater number, that is a pretty good indication that is the LCN.

Ok what I've done is to add the other freqs in and set them up like this.
Left the other ones up like they were but added lcn four through fifteen.
Those were the other freqs i found.
So this won't hurt anything will it?
Also i noticed that the control only mode was checked on the LTR but i
unchecked it but does it really matter or could this mess with the way it
scans?
Hey thanks guys.

One thing you could do is monitor the other frequencies to see if you
hear an LTR beacon on them. It should happen about every 10 seconds or
so and will be a brief transmission.

Joe M.

From: MCH
Topic: 5910 Message: 6006

It won't hurt anything, but odds are they won't work.

You can't just guess at the LCN. You have to assign the actual LCN for
that frequency in order for it to work.

Program each frequency in a different system 20 times and assign each
channel a different LCN. The one that you hear activity on will be the
correct LCN for that frequency.

From: Jerry Mader
Topic: 5910 Message: 6007

Hey there Joe, if i set the scanner up so that it has lcn four through fifteen should this work because i don't know how many ltr lcns a system could have. lol
I don't know how many i can go to

I think you are supposed to turn it completely upside down to remove it without risk of damaging the clip. But, I don't have one handy that is not broken (mine break when I sit somewhere and the seat pushes the scanner up - breaking the clip that holds it in).

Jerry, The license for WQBN728 states it is trunked and has only on
frequency. Its LCN is probably 14 as you stated.
Just create a LTR system with just this LCN. That's all you need to do.
Place the BCD396XT in search mode, (not Scan Mode) to find the Talkgroups.
The other licenses for this hotel are conventional. Just create one
conventional system with these frequencies.
You can give both the LTR system and Conventional system the same System
Quick Key to scan both systems,
or different SQKs, your choice

At 06:34 AM 11/7/2011, you wrote:

how many numbers can a system use for lcn that's ltr?
I don't wanna put in too many lol. But i need to figure out what lcn this hospital security frequency is i hear ltr bursts.
But i can't figure out, how many numbers to use, i mean, do they use more than thirty numbers or does anyone know is there an exact number?

6014. Re: [BCD396XT] trunking an ltr system need help.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-07 21:03:53 UTC
From: Uniden UPMan
Topic: 5910 Message: 6014

According to the wiki article at RadioReference
(http://wiki.radioreference.com/index.php/LTR) LTR can have LCN numbered 01-20.

Here is the relevent section:
================
 LTR Standard talkgroups are written in the format A-HH-GGG.
* "A" is the area code and is either 0 or 1. The area code is the same for all talkgroups in a given system and is arbitrarily chosen by the system operator; the most common use is to simply distinguish between talkgroups on multiple systems.
* "HH" is the home repeater number and has twenty possible values, 01 through 20. A talkgroup will always use its home repeater by default, unless the repeater is already in use by another talkgroup. If the home repeater is in use, the controller will assign another free repeater at random. If no repeater is free (all are in use), then the radio will receive a busy signal.
* "GGG" is the group number and has 254 possible values, 001 through 254.
================
Since this is a single frequency system , I would program the same frequency 20 times, assigning 01-20 (i.e. same frequency 20 times in the system). Then, scan it in ID Search mode. All channels that come up should be in the form:

0-HH-GGG
with "HH" always being the same number...that number also being the actual LCN for the frequency.

If you see multiple values for HH, then this system has more than the one frequency...

From: Uniden UPMan
Topic: 5910 Message: 6015

Cannot answer to the first, but if so, the 6 frequencies over 866 MHz will shift down exactly 15 MHz.

Topic: 5910 Message: 6016

send your question to the SEFlorida yahoo group
I was in Broward earlier and listened just find with the old frequencies.
If something has changes since then, I don't know...

Uniden UPMan wrote:
> According to the wiki article at RadioReference
(http://wiki.radioreference.com/index.php/LTR) LTR can have LCN numbered 01-20.
>
> Here is the relevent section:
> ================
> LTR Standard talkgroups are written in the format A-HH-GGG.
> * "A" is the area code and is either 0 or 1. The area code is the same for all talkgroups in a given system and is arbitrarily chosen by the system operator; the most common use is to simply distinguish between talkgroups on multiple systems.
> * "HH" is the home repeater number and has twenty possible values, 01 through 20. A talkgroup will always use its home repeater by default, unless the repeater is already in use by another talkgroup. If the home repeater is in use, the controller will assign another free repeater at random. If no repeater is free (all are in use), then the radio will receive a busy signal.
> * "GGG" is the group number and has 254 possible values, 001 through 254.
> =================
> Since this is a single frequency system , I would program the same frequency 20 times, assigning 01-20 (i.e. same frequency 20 times in the system). Then, scan it in ID Search mode. All channels that come up should be in the form:

6019. Quick Reference Cards for the XT Scanners

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-08 12:30:45 UTC
From: marksscanners
Topic: 6019 Message: 6019

I have written up Quick Reference cards
<http://www.scannermaster.com/Manuals_s/500.htm&Click=64337?searching=Y&\
sort=1&cat=500&show=20&page=1> for the XT scanners that help you
operate the scanners once you get them programmed.

They have all the key presses for entering and using the various modes
of the scanners on a wallet size 5-fold laminated card so you can take
them anywhere.

Great for trying new modes less used, they allow you to easily use all
of the features of the scanners "on the fly" without having to break out
the manual to figure out how to save a TGID, go to a channel number tag,
change center frequency in Bandscope Mode, etc.

They are the perfect companion to the Easier to Read manual
<http://www.scannermaster.com/Easier_to_Read_Uniden_XT_Scanner_Manual_p/\
47-511554.htm&Click=64337> also available at Scannermaster.

oh it's ok lol. the reason i can't hook a scanner up to this one is because it's a Braille and speak millennium and it won't work with any kind of scanner, works with a Braille printer though which i don't have lol

6028. Audio delay

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-09 02:41:31 UTC
From: V. Singh, MBA, RPhT
Topic: 6028 Message: 6028

I am finally getting the hang of this scanner. However I noticed a slight delay before audio is transmitted from the radio when monitoring Broward County, FL's TRS which is a Motorola Type 2 trunked system.

I verified this further by having my pro-106 monitor the same talkgroup as the bcd396xt. The pro-106 would catch someone say "10-4" while the bcd396xt will only catch the "4". Is this normal for this radio? I turned off the AGC to see if it makes a diff, but no luck there either. Any other ideas?

Thanks,
Singh AJ4VS

Would the P25 delay be set wrong? 500ms might be enough. Just a suggestion.

Based on the description, it sounds like you need to set the channels to "Analog Only." If set to "Both" the scanner will spend about 400 mS at the beginning of every comm evaluating the signal to determine whether it is analog or digital. During this time, it mutes the audio (to prevent digital noise bursts at the beginning of digital comms).

If the channel is set to both (analog and digital) does that "override" P25 delay setting, even if it is set to "zero", no delay?

Thanks Paul.

Glad to hear your response. Hope you have found the culprit. I did not know untill about six months ago that a system could be set up as both analog and P25. Very cool that you can do that. I hope that Uniden comes up with a new scanner soon. It is every couple of years I think. I sometimes wonder what else they can come up with.

Jeff

Hello folks.
I had an idea.
Call me crazy but why couldn't i make the scanner via the tone out standby mode, listen for the EBS tone to go off the one long tone in the middle of the burps or data bursts and turn on?
It's just an idea only.
I thought that could work somehow and wondered if anyone's tried it before?
and then say, have the scanner set to say 30 seconds or inf and leave it on standby?
I'm only asking why this wouldn't work?

You could do that vusing the Tone Out standby. Set Tome A for 0 and Tone
B for 1050 Hz and the frequency as your local NOAA transmitter.

Or you could just use the SAME decoder which will alert only on the
counties you've programmed in.

You can even have the long tone alert happen while scanning. It's called
Weather Priority. But, you would have gaps in the received transmissions.

no no i don't want that one, i wanted to do it using the EBS on the radio
that comes through after the EAS same bursts does. you know that long
attention signal they use/
That's what i was talking about.

You could do that vusing the Tone Out standby. Set Tome A for 0 and Tone B for 1050 Hz and the frequency as your local NOAA transmitter.

Or you could just use the SAME decoder which will alert only on the counties you've programmed in.

You can even have the long tone alert happen while scanning. It's called Weather Priority. But, you would have gaps in the received transmissions.

Oh - you want to do it on the FM Broadcast band. I don't think you can
do that, but I never tried it. I don't recall what the two tones are
that they use, but you would want to use the higher tone. The decoder
might reject it based on the other tone. I think I did try that on some
other dual tone paging, and I don't think it worked.

But again, try it!

6042. Help with programming for EAS over fm broadcast radio

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-13 03:35:33 UTC
From: Jerry Mader
Topic: 6042 Message: 6042

Ok, lol i have 2 tones that are used.
How would any of you suggest i try this lol.
I have a 853 hz signal and a 960 signal this is the attention signal after the data bursts.
Ok so both of these are set together.
Now, should i program one for tone a and one for tone b? or program the 960 hz for b, or what should i do.
Also may I ask, If these two tones are sent together will the scanner still be able to grab the high tone with them both being sent together on the air?
I wish there was a way to make the NOAA weather radio frequencies be adjusted for the fm frequencies in the broadcast band to monitor all eas activity.
Cause out here noaa weather radio doesn't send out the EAS messages just a local radio station does.
Anyone have any idea how i could modify the scanner to use the Same data off the fm radio broadcasts instead of the NOAA weather radio?
Thanks
Jerry Made

I would program tone A for 0 and tone B for 960 Hz.

Decoders will often disregard both tones which would mean it would not work at all.

6044. Same decoder and EAS

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-13 07:20:08 UTC
From: Jerry Mader
Topic: 6044 Message: 6044

Hey anyone know if this can be done with firmware or does this have to be done as a hardware issue?
I would like to see the SAME weather alerts also cover the FM Broadcast band too.
You know so that it can grab the local Primary EAS station in the area and listen for the data bursts as well as NOAA and eliminate the FM broadcast band search all together.
Aren't they all the same anyway, both NOAA weather alert bursts and the EAS bursts?
Why wouldn't this work?
I think it would be easy to just consolidate the 2 since they both could be scanned for the fips info.
This would help those that wanna grab the primary EAS stations and listen for FIPS and emergency data,if they wanted too instead of the NOAA weather radio broadcasts.
Could this be done?
Or am i crazy?
I just only thought it was a great idea since in some areas like Saginaw MI NOAA won't broadcast amber alerts and things like that. And so i thought what a great idea it would be to have the FM and NOAA weather radio band be as one and be able to be scanned for EAS transmitions.

The radio has a gap from 380-399.995

Makes no sense, being this is still within the UHF Mil band 225-400mhz.

The top part of the band is active...especially at air shows...

This could be easily changed in firmware before the radio is released...

The only way public safety could be in this region is if they are operating on a mil trunked system. Mute point since those systems are ALL P25 trunked and this won't be digital. As for airshows they will be moving those frequencies out of this range so that shouldn't be an issue either.

It's still going to be shared by all the existing military aircraft...including the F-35 lightning.

Unless Rockwell or Honeywell change their designs for the future, pilots will still be able to transmit 380.00-399.975mhz...

Looks like there will be a new USA model, but not digital.

They may be able to, but they will have no channel allocations there.
So, effectively they would be transmitting out of their band.

It's not going to be a shared band.

6056. Had a question about testing my scanner to see if it picks up the EBS attention tone.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-17 05:45:03 UTC
From: Jerry Mader
Topic: 6056 Message: 6056

Hey there i just had this question though it might sound dumb here it is.
I previously stated that i just want to pick up the FM radio's EAS transmissions.
I'm aware that during an actual emergency the alert tone that is given is 853 hz and 960 hz put together to make one tone.
I was gonna do as Joe suggested and program the thing to listen for the 960 tone on an FRS frequency and then transmit it via my radio here.
I have a Motorola FRS radio and i have a copy of the EBS attention tones heard on FM broadcast frequencies from 88.0 to 107.9 MHZ.
I wanted to know if i spoke that this was a test before and after playing the tone through the FRS HT would i get in any trouble?
Also would the scanner pick up the tone and trigger it or won't this work because the scanner isn't hearing the tone directly it's hearing it through the HT's microphone used to talk over?
I'm only asking i wanna test this theory and see if Joe's idea works but I don't wanna call the FM station and ask them to just send out the ebs tone not the EAS header.
Because i feel like that would be in the category of bothering them immensely. And I just don't wanna do that. lol
What would any of you suggest?
Thank you.
Jerry Mader

Are you sure that none of your local public safety agencies set off some special tones for weather alerts?

I live in St Clair Co IL about 25 miles from downtown St Louis

Our Emergency Management Agency sets off tones on 155.28 to notify all hospitals and EMS agencies whenever severe weather statements are issued.

No we don't do that here.
I'm very sure of it, I've never heard such tones broadcast on any of our frequencies even fire paging never even goes off.

Topic: 5958 Message: 6059

Joe,

Are you aware a VHF radio in an F-16 can transmit 116.00-151.975mhz?

This implies "Sharing" of the spectrum...

Here's some of the comments from the Navy, Air Force, Marines, and Army regarding their concerns over reallocation of 225-400mhz band.

From NTIA:

Currently the Federal Government through, the Federal Wireless Policy Committee (FWPC), the Federal Wireless Users Forum (FWUF), the Federal Law Enforcement Wireless Users Group (FLEWUG), and the Federal Wireless Review Office (FWRO), are examining the entire range of Federal use of wireless services, including the land mobile radio services. These groups are working to ensure that the emerging wireless services satisfy Government functional requirements. It is also the responsibility of these groups to ensure that Federal users of wireless services can smoothly transition to more spectrum efficient, interoperable, and cost-effective digital technologies.

The 225-400 MHz band is allocated and used for military fixed and mobile communications, military mobile-satellite communications, aeronautical radionavigation functions, and radio astronomy observations. The Preliminary Report provided an overview of the Federal use of the band for fixed, mobile and satellite applications. DOD stated that the 225-400 MHz band is the single most critical spectrum resource of the military tactical forces. There are estimated to be over 75,000 Federal air-to-ground and ground-to-air radio equipments alone operating in this band. This does not include mobile-satellite equipments and backbone point-to-point capabilities, such as the Army's Mobile Subscriber Equipment (MSE) system. DOD reports that extensive peacetime training and alert exercises using these equipments are conducted at military bases throughout the United States to maintain combat readiness. DOD asserts that the military use of this frequency spectrum is predicated on the same technical reasons as the non-Federal users: low atmospheric and foliage penetration losses, availability of inexpensive components, and the ability to use short whip antennas for omni coverage by hand-held units.[EN 82]

Navy states that by their very nature ships and aircraft are very crowded which results in considerable cosite problems that require all the frequency flexibility available to accommodate their requirements in this band. "Aboard ship the intermodulation products inevitably caused by exposure of metallic joints to salt spray combined with the requirement for dozens of UHF communications nets presents a major problem which has been the focus of major efforts for the past 30 years."[EN 83] Navy further states that the need to take these effects into account while various forces shift their tactical relationships and missions on a real-time basis has required a major effort to develop spectrum management programs for task force commanders. Navy contends that any reduction in the 225-400 MHz band available for this spectrum management will have serious consequences in

training and operational capability, particularly in joint exercises and operations, such as Desert Shield and Desert Storm.

Subsequent to release of the Preliminary Report, DOD provided further amplification on use of this band.[EN 84] Reports from numerous military commands throughout the country expressed concern that loss of access to portions of this band would cause severe spectrum crowding in the remaining portions, leading to significantly increased training costs, degradation of command and control, and possible safety concerns. However, DOD stressed that the most serious factors affecting reallocation are the extensive use of radios having the HAVEQUICK II frequency hopping architecture, mobile-satellite communications, and backbone point-to-point transportable capabilities. Air Force further states that other uses of this spectrum include support of critical missile and Expendable Launch Vehicle (ELV) launch operations, test range telemetry, remote control of targets, communications supporting Air Defense Sectors, reliable training communications, and support of the President of the United States.

Air Force states that the HAVEQUICK family of radios is extensively deployed by the military services in a wide variety of fighter, tanker, close air support, reconnaissance, and bomber aircraft. Typical functions include approach/departure control at military airfields, air-to-air re-fueling operations, vectoring of fighter aircraft to engage hostile threats, and coordination between strike aircraft. Air Force reports that over 15,000 units are in their current inventory. The HAVEQUICK II radios have the capability of frequency hopping across many individual frequencies over the 225-400 MHz band. Air Force states that this basic architecture is necessary to provide two fundamental aspects that enhance the electronic countermeasures (ECM) resistance of frequency hopping radios: a large number of channels and a wide spread in the bandwidth covered by those channels. Air Force adds, "Interoperability between equipments is mandatory and frequency hopping radios must have the capability to hop on the same frequencies and under the control of a master clock."[EN 86] To maintain the necessary interoperability, Air Force asserts that all of the HAVEQUICK radios would have to be returned for reprogramming. Based on the conversion of HQI to HQII, Air Force maintains that such reprogramming is very costly and time consuming.[EN 87] Air Force indicates that to allow communications to continue while the modification is in progress, the modified radios must retain both the old and new capability until a specified change-over date. Existing radios without space for two sets of control software must be discarded. DOD expressed further concern over the loss of the anti-jam capability inherent to the HAVEQUICK II radios that would result from any loss of access to the full band. Reported costs from the various military commands that would result from reallocating any portion of the 225-400 MHz band total well over $1 billion.

The Air Force Satellite Communications System (AFSATCOM) and Milstar Satellite Communications System use the 225-400 MHz band, including the 380-400 MHz band segment, to provide survivable, jam-resistant communications for strategic and tactical military over the horizon requirements. Examples include communications to base from aircraft flying close to the ground to avoid hostile radar, over the ocean connectivity with cargo aircraft, extraction of personnel from areas far from friendly forces, and quick communications establishment with National authorities at the start of and during humanitarian missions. DOD reports that if reallocation of any portion of the 225-400 MHz band occurred, AFSATCOM and Milstar systems users would be subjected to interference from non-Federal users, severely reducing the usefulness of critical communications during certain missions. Air Force adds that the on-orbit and in storage satellites cannot be retuned and military missions must still be performed. In addition to unavoidable interference to non-Federal users, DOD investment in equipment estimated at over $1 billion

would be jeopardized.

Army states that they are the primary user of line-of-sight multichannel radios in the 225-400 MHz band that are integrated as part of a theater wide network. Army uses these radios for terrestrial communications linking the functional areas of communications, command and control, intelligence, air defense, artillery fire support, aviation support, and logistical support. Army further states that this portion of the spectrum is critical to land force dominance.

From the preceeding discussion it can be seen that the 225-400 MHz band is crowded with many disparate kinds of military telecommunications systems. These systems are able to work in the same environment at the same time due to disciplined users operating in a hierarchical command structure, an acknowledgment by users that interference will occur, and a highly structured military spectrum management system. DOD believes that none of these conditions necessarily exist for non-Federal users. At the very least, military use of this spectrum indicates that sharing by dissimilar services is a possibility worth considering. As directed by Congress, NTIA has initiated a strategic planning program to develop long-term spectrum planning. The first effort of the strategic planning program will identify the long-term spectrum requirements of both the Federal agencies and the non-Federal users. The long-range spectrum requirements identified below 1 GHz will be considered together with various spectrum management options, and as necssary, reallocation decisions will be made.

Furthermore, the FCC has been directed by Congress to identify the spectrum needs of the public-safety agencies, and to report its findings to Congress. In response to this Congressional mandate, on February 9, 1995, the FCC released the "Spectrum Needs through the Year 2010" report. NTIA, as well as, the Federal wireless working groups (e.g., FLEWUG, FWPC, and FWRO) will consider these spectrum needs in their long-term spectrum planning programs.

From NTIA Ch. 4, USA Allocation is on the right hand column:

Seems shared, interoperability...

There are a few angles that come to mind.

First, the proper way of testing this is on an unused FM Broadcast frequency using a signal generator fed with the recording of the tones.

I think you could test using an FRS portable, but that is definitely getting into a gray area. And it still won't solve what I think is the largest problem - will the FTO function allow you to enter and use FM Broadcast frequencies?

The second problem is whether the decoder will decode either of the tones from the test. If it is a digital recording, the playback should be accurate enough to tell if it will work or not. You could even use the FTO SEARCH function to decode the tones to see if anything does decode. Analog recordings (tape) often will skew the tones enough that they will not play back accurately. But again, digital recordings should work fine.

From: MCH
Topic: 6056 Message: 6061

Jerry,

I was just doing some testing, and the entire issue is a moot point
since the FTO mode does not support the modulation used by FM Broadcast.
So, all other issues aside, it will not work.

6062. Re: [BCD396XT] Uniden will introduce it's new Digital Handheld Scanner next year 2012

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-17 11:42:55 UTC
From: MCH
Topic: 5958 Message: 6062

It appears much of that information is outdated, and some even appears to be a response to the proposed (at the time) reallocation of the 380 MHz band to Federal trunking systems.

As for radio capabilities, are you aware that the Wolfsburg radios used in many aircraft can transmit on any public safety frequency (and virtually any frequency). That does not mean the VHF public safety band is shared with aircraft. Virtually any business radio can be programmed on ham frequencies. That does not mean the ham bands are shared with business users.

The point is that just because someone has a radio that *can* transmit somewhere does not mean they are legally allowed to transmit there. I will also add the caveat that in military operations, they can (and likely do) use any frequency across the entire spectrum - regardless of the legal allocations.

Early on there was question about the MilAir users in the 380-400 MHz range, and it was stated that these users would be moved to the remaining MilAir spectrum (225-380 MHz). In fact, it's been some time since I can recall hearing MilAir users on 380-400 MHz. Not saying there are not some still there, but they should be moving so as not to cause interference to the new users of that band segment.

>
> Currently the Federal Government through, the Federal Wireless Policy Committee (FWPC), the Federal Wireless Users Forum (FWUF), the Federal Law Enforcement Wireless Users Group (FLEWUG), and the Federal Wireless Review Office (FWRO), are examining the entire range of Federal use of wireless services, including the land mobile radio services. These groups are working to ensure that the emerging wireless services satisfy Government functional requirements. It is also the responsibility of these groups to ensure that Federal users of wireless services can smoothly transition to more spectrum efficient, interoperable, and

cost-effective digital technologies.
>
> The 225-400 MHz band is allocated and used for military fixed and mobile communications, military mobile-satellite communications, aeronautical radionavigation functions, and radio astronomy observations. The Preliminary Report provided an overview of the Federal use of the band for fixed, mobile and satellite applications. DOD stated that the 225-400 MHz band is the single most critical spectrum resource of the military tactical forces. There are estimated to be over 75,000 Federal air-to-ground and ground-to-air radio equipments alone operating in this band. This does not include mobile-satellite equipments and backbone point-to-point capabilities, such as the Army's Mobile Subscriber Equipment (MSE) system. DOD reports that extensive peacetime training and alert exercises using these equipments are conducted at military bases throughout the United States to maintain combat readiness. DOD asserts that the military use of this frequency spectrum is predicated on the same
tec
> hnical reasons as the non-Federal users: low atmospheric and foliage penetration losses, availability of inexpensive components, and the ability to use short whip antennas for omni coverage by hand-held units.[EN 82]
>
> Navy states that by their very nature ships and aircraft are very crowded which results in considerable cosite problems that require all the frequency flexibility available to accommodate their requirements in this band. "Aboard ship the intermodulation products inevitably caused by exposure of metallic joints to salt spray combined with the requirement for dozens of UHF communications nets presents a major problem which has been the focus of major efforts for the past 30 years."[EN 83] Navy further states that the need to take these effects into account while various forces shift their tactical relationships and missions on a real-time basis has required a major effort to develop spectrum management programs for task force commanders. Navy contends that any reduction in the 225-400 MHz band available for this spectrum management will have serious consequences in training and operational capability, particularly in joint exercises and operations, such as Desert Shield and
Des
> ert Storm.
>
> Subsequent to release of the Preliminary Report, DOD provided further amplification on use of this band.[EN 84] Reports from numerous military commands throughout the country expressed concern that loss of access to portions of this band would cause severe spectrum crowding in the remaining portions, leading to significantly increased training costs, degradation of command and control, and possible safety concerns. However, DOD stressed that the most serious factors affecting reallocation are the extensive use of radios having the HAVEQUICK II frequency hopping architecture, mobile-satellite communications, and backbone point-to-point transportable capabilities. Air Force further states that other uses of this spectrum include support of critical missile and Expendable Launch Vehicle (ELV) launch operations, test range telemetry, remote control of targets, communications supporting Air Defense Sectors, reliable training communications, and support of the President of the U
nit
> ed States.
>
> Air Force states that the HAVEQUICK family of radios is extensively deployed by the military services in a wide variety of fighter, tanker, close air support, reconnaissance,

and bomber aircraft. Typical functions include approach/departure control at military airfields, air-to-air re-fueling operations, vectoring of fighter aircraft to engage hostile threats, and coordination between strike aircraft. Air Force reports that over 15,000 units are in their current inventory. The HAVEQUICK II radios have the capability of frequency hopping across many individual frequencies over the 225-400 MHz band. Air Force states that this basic architecture is necessary to provide two fundamental aspects that enhance the electronic countermeasures (ECM) resistance of frequency hopping radios: a large number of channels and a wide spread in the bandwidth covered by those channels. Air Force adds, "Interoperability between equipments is mandatory and frequency hopping radios must have the
cap
> ability to hop on the same frequencies and under the control of a master clock."[EN 86] To maintain the necessary interoperability, Air Force asserts that all of the HAVEQUICK radios would have to be returned for reprogramming. Based on the conversion of HQI to HQII, Air Force maintains that such reprogramming is very costly and time consuming.[EN 87] Air Force indicates that to allow communications to continue while the modification is in progress, the modified radios must retain both the old and new capability until a specified change-over date. Existing radios without space for two sets of control software must be discarded. DOD expressed further concern over the loss of the anti-jam capability inherent to the HAVEQUICK II radios that would result from any loss of access to the full band. Reported costs from the various military commands that would result from reallocating any portion of the 225-400 MHz band total well over $1 billion.
>
> The Air Force Satellite Communications System (AFSATCOM) and Milstar Satellite Communications System use the 225-400 MHz band, including the 380-400 MHz band segment, to provide survivable, jam-resistant communications for strategic and tactical military over the horizon requirements. Examples include communications to base from aircraft flying close to the ground to avoid hostile radar, over the ocean connectivity with cargo aircraft, extraction of personnel from areas far from friendly forces, and quick communications establishment with National authorities at the start of and during humanitarian missions. DOD reports that if reallocation of any portion of the 225-400 MHz band occurred, AFSATCOM and Milstar systems users would be subjected to interference from non-Federal users, severely reducing the usefulness of critical communications during certain missions. Air Force adds that the on-orbit and in storage satellites cannot be retuned and military missions must still
be
> performed. In addition to unavoidable interference to non-Federal users, DOD investment in equipment estimated at over $1 billion would be jeopardized.
>
> Army states that they are the primary user of line-of-sight multichannel radios in the 225-400 MHz band that are integrated as part of a theater wide network. Army uses these radios for terrestrial communications linking the functional areas of communications, command and control, intelligence, air defense, artillery fire support, aviation support, and logistical support. Army further states that this portion of the spectrum is critical to land force dominance.
>
>>From the preceeding discussion it can be seen that the 225-400 MHz band is crowded with many disparate kinds of military telecommunications systems. These systems are able to work in the same environment at the same time due to disciplined users operating in a hierarchical command structure, an acknowledgment by users that interference will occur, and a highly structured military spectrum management system. DOD believes that none of

these conditions necessarily exist for non-Federal users. At the very least, military use of this spectrum indicates that sharing by dissimilar services is a possibility worth considering. As directed by Congress, NTIA has initiated a strategic planning program to develop long-term spectrum planning. The first effort of the strategic planning program will identify the long-term spectrum requirements of both the Federal agencies and the non-Federal users. The long-range spectrum requirements identified below 1 GHz will be considered together wit
h v
> arious spectrum management options, and as necssary, reallocation decisions will be made.
>
> Furthermore, the FCC has been directed by Congress to identify the spectrum needs of the public-safety agencies, and to report its findings to Congress. In response to this Congressional mandate, on February 9, 1995, the FCC released the "Spectrum Needs through the Year 2010" report. NTIA, as well as, the Federal wireless working groups (e.g., FLEWUG, FWPC, and FWRO) will consider these spectrum needs in their long-term spectrum planning programs.

Joe:

Thank you for using the correct term (moot...although in this particular case, the scanner would also remain mute). :)

Jerry: To my knowledge, the only scanner that does what you want (trigger on an EAS alert on AM/FM broadcast stations) is the BC370CRS.

Jerry,

I was just doing some testing, and the entire issue is a moot point
since the FTO mode does not support the modulation used by FM Broadcast.
So, all other issues aside, it will not work.

Joe M.

6066. Re: [BCD396XT] Had a question about testing my scanner to see if it picks up the EBS attention tone.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-17 15:18:06 UTC
From: Uniden UPMan
Topic: 6056 Message: 6066

It is strictly conventional (desktop model) but covers VHF/UHF/800.

However, it is fully compliant with the "All Hazards" standard (including the ability to trigger auxiliary audio/visual alerts) and as far as I am aware is the only consumer-grade product that will alert on the EAS activiation signals when sent over AM and FM broadcast systems.

6067. Australian Scanner what are we worried about?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-17 15:24:32 UTC
From: RJH
Topic: 6067 Message: 6067

Hi all,

If this is an Australian Scanner what are we wasting the band width on?

Ray

It isn't clear from your post what discussion thread you are talking about.

UBC396XT is a newly announced Australian model.

BC125AT is a newly announced model from Uniden America (but really, it is time for the discussion of it to move to http://groups.yahoo.com/group/BC125AT).

I'm seeing it listed online anywhere from about $125-$149.
Here are a couple of sales links (but not the only ones, and I'm not recommending you buy it from any particular place...they are just convenient links):

http://www.amazon.com/Uniden-300-Channel-Clock-Radio-Scanner/dp/B000EVWC9C
http://www.scannermaster.com/Uniden_Bearcat_BC370CRS_Police_Scanner_Radio_p/10-501057.htm

Yes Joe, I'm aware of that radio. I have been around Air Attack (Air Tanker lead aircraft) utilized by the CDF.
I think the word "shared" is a semantic issue here.

Yes, that was my point in bringing up the F-16 UHF radio.

Obviously, we both understand, my point was intraoperability was a partial solution to such an involved and diverse use of the UHF P-Band. The Kenwood NX-8000 mobile radio will TX/RX in Digital mode either 6.25 or 12.5khz to fulfill Narrow Band requirements. Military Aircraft radio's most granular tuning is 25khz. This is an example of intraoperability within
380-400mhz.

Show me the NTIA Redbook section(s) or a document that reads the final outcome of this dilemma, the reallocation of

the P-band, as to resolve this question.

The last two airshows I attended with fellow radio users was in October. At both shows, the common UHF Demo Freq. which falls
within the 380-400mhz was still being used...not sure what part of the country you reside in, or how much of your hobby is
devoted to listen to P-Band coms, however, I continue to hear activity in the reallocated band. UHF AM along side newer federal trunk systems.

Send me links of the final outcome. Thanks.

> >
> > Subsequent to release of the Preliminary Report, DOD provided further amplification on use of this band.[EN 84] Reports from numerous military commands throughout the country expressed concern that loss of access to portions of this band would cause severe spectrum crowding in the remaining portions, leading to significantly increased training costs, degradation of command and control, and possible safety concerns. However, DOD stressed that the most serious factors affecting reallocation are the extensive use of radios having the HAVEQUICK II frequency hopping architecture, mobile-satellite communications, and backbone point-to-point transportable capabilities. Air Force further states that other uses of this spectrum include support of critical missile and Expendable Launch Vehicle (ELV) launch operations, test range telemetry, remote control of targets, communications supporting Air Defense Sectors, reliable training communications, and support of the President of the U
> nit
> > ed States.
> >
> > Air Force states that the HAVEQUICK family of radios is extensively deployed by the military services in a wide variety of fighter, tanker, close air support, reconnaissance, and bomber aircraft. Typical functions include approach/departure control at military airfields, air-to-air re-fueling operations, vectoring of fighter aircraft to engage hostile threats, and coordination between strike aircraft. Air Force reports that over 15,000 units are in their current inventory. The HAVEQUICK II radios have the capability of frequency hopping across many individual frequencies over the 225-400 MHz band. Air Force states that this basic architecture is necessary to provide two fundamental aspects that enhance the electronic countermeasures (ECM) resistance of frequency hopping radios: a large number of channels and a wide spread in the bandwidth covered by those channels. Air Force adds, "Interoperability between equipments is mandatory and frequency hopping radios must have the
> cap
> > ability to hop on the same frequencies and under the control of a master clock."[EN 86] To maintain the necessary interoperability, Air Force asserts that all of the HAVEQUICK radios would have to be returned for reprogramming. Based on the conversion of HQI to HQII, Air Force maintains that such reprogramming is very costly and time consuming.[EN 87] Air Force indicates that to allow communications to continue while the modification is in

progress, the modified radios must retain both the old and new capability until a specified change-over date. Existing radios without space for two sets of control software must be discarded. DOD expressed further concern over the loss of the anti-jam capability inherent to the HAVEQUICK II radios that would result from any loss of access to the full band. Reported costs from the various military commands that would result from reallocating any portion of the 225-400 MHz band total well over $1 billion.
> >
> > The Air Force Satellite Communications System (AFSATCOM) and Milstar Satellite Communications System use the 225-400 MHz band, including the 380-400 MHz band segment, to provide survivable, jam-resistant communications for strategic and tactical military over the horizon requirements. Examples include communications to base from aircraft flying close to the ground to avoid hostile radar, over the ocean connectivity with cargo aircraft, extraction of personnel from areas far from friendly forces, and quick communications establishment with National authorities at the start of and during humanitarian missions. DOD reports that if reallocation of any portion of the 225-400 MHz band occurred, AFSATCOM and Milstar systems users would be subjected to interference from non-Federal users, severely reducing the usefulness of critical communications during certain missions. Air Force adds that the on-orbit and in storage satellites cannot be retuned and military missions must still
> be

From: Lance
Topic: 6072 Message: 6072

As I mentioned in the last response concerning the use of the 380-400 DoD LMR band, specifically, my distinction of UHF AM Radio's tuning in 25khz increments, vs Digital NBFM LMR
utilizing 6.25khz and 12.5khz spacing respectively, as an example of "Interoperability", here is an excerpt from Larry Van Horn,
of MT (Monitoring Times) regarding the restructuring of this portion of the P-Band:

So Joe, it's quite obvious at this point, it's shared DoD spectrum...

Interesting my response to your last email was edited out of the group post...

If your going to state your claims as the only opinion that is correct or "word", then what's
the point of having a conversation, a dialog, or exchange of information for a group?

Later,

-Lance

From: George
Topic: 5958 Message: 6074

I believe the change was directed by MCEB-M-001-04 Annex G of 1 April 2004.
There was also an August 2001 SecDef memo. The entire 380-399.9 band became
DOD Land Mobile. Everything is supposed to be P25, 12.5 kHz or less.

George KD4UKH

Yes Joe, I'm aware of that radio. I have been around Air Attack (Air
Tanker lead aircraft) utilized by the CDF.
I think the word "shared" is a semantic issue here.

Yes, that was my point in bringing up the F-16 UHF radio.

Obviously, we both understand, my point was intraoperability was a partial
solution to such
an involved and diverse use of the UHF P-Band. The Kenwood NX-8000 mobile

radio will
TX/RX in Digital mode either 6.25 or 12.5khz to fulfill Narrow Band
requirements. Military
Aircraft radio's most granular tuning is 25khz. This is an example of
intraoperability within
380-400mhz.

6075. programming question

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-11-19 14:54:08 UTC
From: Matt Pulsts
Topic: 6075 Message: 6075

OK so im trying to clean up the programming on my 396xt a bit.

on a typical p25 system, should i program the audio type for digital only? or both analog and digital?

Specifically im looking at dekalb cnty GA systems. Ive played a little bit with both settings and cant tell much difference in the little time ive been paying attention.

is thre a best practce for this?

6076. Re: [BCD396XT] programming question

On a P25 system, the scanner has no option for audio type (since every channel is digital).

On a Motorola system that has both analog and digital channels, you should set the audio type to match the content of the channel (analog only, digital only, or, rarely, both).

On P25 systems, you cannot select analog or digital - the scanner is 'strapped' to digital only, as that is all that is on a P25 system.

If you are talking about a Motorola Type II system that has P25 talkgroups, I would only select digital only if the system only has P25 talkgroups and no analog talkgroups at all.

It looks like that county has two systems - one P25 and one Type II that is analog only. So, you could set the latter one to analog only.

Uniden should at least give us back the manual P25 threshold setting that exists on the 396T. My 396T sounds better than my 386XT on the local Moto II simulcast system. Not great but better.

>
> I believe if your experiencing multi-path problems due to being in the overlap area between multiple simultaneous transmitters, then in general your stuck with it (or move). Some receivers may be a little worse or a little better than others, but I don't think the problem will disappear. Best way I can think of to improve situation is a highly directional antenna, if you are in a fixed location, pointed at the strongest transmitter. digital decode threshold won't help you if you're losing the control channel.

If you attempt to adjust the threshold level, you will find that there is no way to set the 396XT to manual threshold adjustment. It is auto threshold adjustment only. What you can adjust is the RSSI value where the auto adjustment starts functioning. That's no help since the auto adjustment doesn't set the correct level for all situations.

You can also check out post http://groups.yahoo.com/group/BCD996XT/message/792
I will be in Saginaw next week. I will take by BCD396XT and give it a try. I have found the manual adjustment works on some systems and others work better set to auto. I think Saginaw is a simulcast system so it's not going to be perfect but I'll give it a try next week.

What manual adjustment? I have seen a few discussions regarding the lack of a manual adjustment on the XTs and I don't recall an answer being given.

6083. No voice after a couple of weeks

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-12-06 10:33:42 UTC
From: boeing52au
Topic: 6083 Message: 6083

Hi after about 2-3 weeks of 24/7 operation my 396xt stops producing voice from a P25 site. The display shows it still ID searching/scanning and the signal strength bar graph is active. When I press hold, the 'engine' noise is there, so it looks like the RF side is working.

A power off/on by button makes no difference. Only if I pull out the power cord and the batteries (a total power down) will it produce voice again.

Could this be some sort of memory leak issue with time?

Any advice appreciated thanks..

I think thats one of the "bugs" that the most recent "firmware" upgrade you will find on the Uniden Firmare Update list fixes where the scanner stops receiving a P25 system....You need to go to maybe www.marksscanners.com and see if he has that update or the files on here.....

Here's what the last firmware change addresses. Read the last line...

What is Changed by This Update?
This update makes the following changes to your BCD396XT scanner:
Add support for storing Unit IDs in channels with alpha tags.
Fixed a problem where corrupted memory caused by a bad PC programming upload would make the scanner lock up on the copyright screen.
Fixed a bug that caused a bad hit count with some PC software.
Save Hold status immediately instead of at power-down.
Add ATT indication in Close Call Only mode
Fixed a bug that could cause APCO P25 decoding to stop in some conditions.

You should always get updates only from the Uniden website. That
way you are ensuring that you are getting the latest update.

6089. Unit for sale

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-12-09 05:51:42 UTC
From: Cris Hanna
Topic: 6089 Message: 6089

Do not have the original antenna, but will include another antenna, otherwise the unit is in great working order

Uniden AC Charger

Several BNC to SMA adapters

Leather case with swivel belt clip and 3 of the plastic belt clips

No original boxes or manual

$375.00 plus 10.00 for UPS Ground Shipping to anywhere in the US

Payment by Paypal only (you do not have to have a paypal account to make a payment) unless you're local.

Cris Hanna

Belleville IL (near St Louis)

Email me directly if you have questions about the unit

[Non-text portions of this message have been removed]

From: Cris Hanna
Topic: 6089 Message: 6093

Nope...don't think I be doing an HP I know you can carry it like a portable...not sure its that good for that

Most likely either the GRE 500 or the RS version , I have the GRE 600 in the car and very happy with it

I just don't like the way Uniden's set up the scanning banks or the systems programming for trunking.

I'm seeing a lot of 396XT's for sale this past month and a half.

Perhaps some are turning to the HP-1...

Thanks,

-Lance

6094. sound cuts out on A/C power

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-12-09 15:35:04 UTC
From: Frank Leidy
Topic: 6094 Message: 6094

Group,

My radio recently started doing something weird. I noticed yesterday the following yesterday:

- Audio cuts out
- key beeps sometimes don't happen
- rapid ticking noise when no active transmission

I thought it was a problem with the mike jack, but it happens on speaker as well. This morning I realized the problem went away when I unplugged the radio.

My current thought is this is a problem with the A/C Adapter. Does anyone have any thoughts on this? I'm going to try the power supply from my 396T tonight.

Any help or advise would be appreciatd.

Thanks,
Frank

6097. WV Statewide Interoperable Radio Network (SIRN) - Digital scanner only?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-12-15 17:02:47 UTC
From: danny r
Topic: 6097 Message: 6097

I'm a BCD396XT owner. I pick up the WV Statewide Interoperable Radio Network (SIRN) with no problem. I advised someone to get the BCD346XT, and tried to put (SIRN) into it, thinking it was trunked but not digital.

However, seems it is digital, as I can't load it in. On RR it didn't mention it being digital (just trunked) and when my scanner scans it, I never noticed it given me any indication it was decoding a digital signal.

Below is 2 links, to (SIRN). One being there homepage and the other radio reference homepage on SIRN.

http://www.sirn.wv.gov/Pages/default.aspx
http://www.radioreference.com/apps/db/?sid=4076

My question is 2 parts:
1. Is it for sure that (SIRN) can only be picked up by a digital scanner (trunking is NOT good enough)?
2. How would I have knew that, either by the RR database webpage and/or my scanner (BCD396XT).

Any help is greatly appreciated.

Thanks for your reply. I looked up FDMA and it says: "FDMA can be used with both analog and digital signal."
Or was it something else on that line that made me know it digital?

UPMan,

Never mind. It seems its the project 25 that is digital only.

http://en.wikipedia.org/wiki/Project_25

Makes me wonder how much use the BCD346XT trunking ability can be used.

Well, Least now I know I was getting use out of my digital BCD396 after all. On the bad side, I'm going to give the 200 dollars back to the women I bought the 346 for, so I got a 200 dollar paper weight on my hands. Hopefully, I can sell or return.

Thanks for your help.

6103. Fire Department Squeals

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-12-19 02:25:57 UTC
From: briandguth
Topic: 6103 Message: 6103

In listening to my local fire department dispatch, I sometimes hear the alarms or high pitched frequencies before they announce a call.

Is there any setting on the scanner that eliminates these sounds?

Any an all assistance is appreciated.

Topic: 6103 Message: 6104

The short answer is: No.

The tones you hear are designed to open receivers that monitor the frequency, but do not pass the audio to the speaker until those tones are received. (what your scanner calls "Fire Tone-Out")

The alerts you hear are designed to get the attention of those who are monitoring the frequency.

You could try using the CTCSS/CDCSS feature (if the frequency in question uses it), but most dispatching centers transmit the CTCSS/CDCSS along with the tones even though they are not supposed to do that.

You could also try the Data Skip feature, but then you would likely miss any of the dispatch calls if you listen to any significant number of channels, as that feature causes the scanner to resume scanning. And you would still hear part of the tones.

Nope. Those are tone-outs or station alerts, most likely and unfortunately you're stuck with it.

Post from RR Thread about the news link you posted...

H.R.3630 (as passed out of the House last week) would do just that (although the reporter got the timing of the loss of the 700 MHz narrowband spectrum wrong - it read "five years after certification by the administrator"). However, the bill was totally gutted and amended in the Senate, so the version that will be voted on today does not have any of the spectrum provisions in it.

See: <http://www.gpo.gov/fdsys/pkg/BILLS-112hr3630eas/pdf/BILLS-112hr3630eas.pdf>

Danny, when you go to the WV Statewide system in the RR Database and you are on the systems talk group page the top header shows in this order DEC,HEX, MODE , Alpha Tags,Description in blue. If you click on the header named "MODE" it will give you a pop up list of that abbreviation and all others the letter "D" stands for digital

6111. Uniden BCD396XT with MANY accessories!

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-12-24 05:09:53 UTC
From: don_ka9rxk
Topic: 6111 Message: 6111

So Santa didn't bring you the DIGITAL APCO 25 SCANNER that you asked him for. Well don't fret . . . here is a great opportunity to own a Uniden BCD396XT scanner with MANY accessories. I have decided that I would prefer a base scanner (like the Uniden BCD996XT or the HomePatrol-1), so I am selling my Uniden BCD396XT with all of these wonderful accessories. I can't think of of anything else that you would need. Just download a FREE copy of the computer program called: FreeScan, and start programming in all of your frequencies. You will not be disappointed! The scanner comes complete as shown in the picture. It includes:

Uniden BCD396XT Digital APCO 25 Scanner with original Uniden antenna (scratch and dust free)
Uniden box and Uniden documentation
(8) Energizer NIMH AA rechargeable batteries
SMA-to-BNC adapter
Radio Shack stubby race scanner antenna - only 1.7 inches tall
Radio Shack 800MHz scanner antenna - also works great on VHF & UHF
AC power cord
Serial programming cable
Soft carrying case
Hard leather carrying case with swivel belt loop - very nice!
Carrying strap
Home brew automotive air vent mount (using Uniden belt clip)
Additional Radio Shack belt clip

Scanner is 100% operational, and comes from a smoke-free user.
Pictures available upon request. $425 with FREE shipping to anywhere in the lower 48 states

6112. Uniden 396XT and discone

Yahoo group: BCD396XT (2011 — 2014)

From: enriqueeeeee2001
Topic: 6112 Message: 6112

Hello,

I write here because I am quite disappointed with my 396XT handheld.

I use it with a Nagoya NA-771 antenna and the general perfomance it is quite good. Last week I set up a double discone antenna on the roof
together a top low loss Ecoflex cable, just to say that the perfomance
let much to be desired. I can hear much stuff with the Nagoya.

Yes, the attenuator is off and I have checked all the connectors, wire, installation and everything is fine.

Now I regret selling my beloved AOR AR5000 in order to buy this Uniden.

Anybody has this problem? Would it be better to sell it and buying a Realistic pro 2006 ?

Thank you and best wishes !

I'm confused. Your scanner works fine with the Nagoya, but not with the Discone, so it *must* be the scanner that is the problem?

I've had the same experience with several Discone models on many receivers. I would say your issue is with the Discone, not the scanner. I've received stations on a rubber duck better than the Discones. I am not exaggerating - I mean that literally!

I would recommend selling the Discone and putting up a Scantenna. They work about as well as anything, and excel on VHF. They are a little weak on 800, but still much better than a Discone.

Maybe the coax is shorted somewhere, or you have an improperly installed connector. How long of a coax run is it? In some cases the cable losses can exceed any benefit from an external antenna.

Ken

When you say double discone are you meaning one or two antenna's? You should use just ONE or they work against each other. It's deffinately NOT a scanner issue though. Discones are great antennas and I have one up that lets me hear Louisville Ky VHF high 110 miles away year round.

Diversity reception usually works to benefit reception unless the signals are received 180 degrees out of phase (such as having two antennas half a wavelength apart for signals coming from either 'end').

But, I'm pretty sure he is talking about the antennas that look like a discone mounted upside down on top of another discone. They sell them at some scanner outlets.

Just wish I could find one that lets me hear the WX station about 40 miles away as well as my rubber duck (or hear the other one about 40 miles in the opposite direction).

WX station reception:

With the rubber duck (stock) = 3 stations. (25-40 miles away)

With the Discone = 1 station readable (not strong). (25 miles away)

With the Ringo Ranger (VHF) = 5 stations. (25-75 miles away)

With the Scantenna II = 5 stations. (25-75 miles away)

Gidday Scanner Enthusiast,

I run a single Diamond discone ant, fed with RG-214, and just run a small bit of RG58 on the end for flexability.
I have run this for some years and even have changed houses, and still is running well.

It is also fairly resonant on Amateur VHF and UHF bands and sometimes use it as a spare ant to TX on.

When I first bought my Yaesu FT-817, I had no ant at that stage for 6m (50MHz), and so used the discone.
I ended up working a station on SSB from Sydney to Adelaide which was 2000km.

Never heard of a double discone before, and that is where your problem may lie, as someone previously
said. Try just connecting one up in the conventional way and see how you go.

Regards,

Doug VK2XLJ

Usually but I found that some do just the opposite. As for discones I have never had an issue with them. With the present one that is up at 65 to 70 feet it's picking up 4 weather stations, one of which is in Ohio 50+ miles away. Unfortunately I do not remember where I got it or which model it is. I remember it cost barely under $150 but that’s all. I have had it for 10 years and it's survived a tornado only loosing part of one radial, not bad considering two of my towers came down along with 40 trees in my yard!

Ummm... You only need tall antennas if your area(Home) isn't very high!

If the home is on top of a mountain. You only need to put the antenna on 1 foot poll above the house or use something else. Plus using a short cable to the antenna. :-)

Talking about antenna heights doesn't really mean anything. You need to talk about the whole area with it.

OK. The rest of my 'story' is that I am at an average elevation for my area. I have valleys 400 feet lower and hills 400 feet higher. I have a fair horizon in most directions except ENE.

But, putting my antennas up 65-70 feet means they will be above the treeline that is currently shading my antennas (not so much this time of year, but greatly in the summertime).

But, the same is true on top of those hills. In each case the relative performance of the antennas I mentioned is the same. True, you do get more range on the hills, but that just means the numbers go up.

lol, you have short trees Joe :) Even at the height my antenna is I am no where near the tree tops. It plays havoc with any signals, but then this is flat Indiana farm land around here.

Well, in some directions the trees are hundreds of feet below ground level (which in WPA isn't all that level - especially compared with your area). Of course, in other directions the roots are hundreds of feet higher.

Generally, I would say the trees in my area are about 50 feet tall - maybe a little more. Typically they are Pine or Maple (long needle Pine trees suck up 800 MHz signals like a steel wall, but I don't have any of those close). I have some Dogwood trees that are less than 15 feet tall despite being decades old. I do have a few Oak trees that are probably around 75 feet tall. Still, an antenna at that height would have little obstruction.

From: enriqueeeeee2001
Topic: 6112 Message: 6126

Hello and thanks everybody for your answers,

I have again checked the cable, is not shorted it works as it should.

The double discone it is only an antenna. I send you a link in order you can see it physically:

http://www.t2wholesale.co.uk/CB_and_Scanners_Scanning_Antennas/Double_Discone_Antenna/

From the roof to my shack there are 65 feet and I said before the cable is one of the best with very low loss. I have tested it with my
HF receiver and works quite good.

Maybe the solution it is to put a preamplifier in the base of the antenna.

Thank you very much for your valuable help !

6127. CC Dump Question and Trunk Ch Assignment

Yahoo group: BCD396XT (2011 — 2014)
Date: 2011-12-31 16:27:00 UTC
From: K3RWN
Topic: 6127 Message: 6127

Does anybody on the list know if there is detailed description of the data which is generated by the CC Data Dump. I have the stuff from the reference guide but I see some data that is not defined in the guide. For example:

MOT,0B7,0,ACFE,PN

MOT,0B7,0,ACFE,PN

I see nothing in the guide which pertains to the PN, I also see UN and CGN, at times, nothing on those either.

Also is the Motorola 800 mhz channel chart the same for Type I and Type II systems For example

Ch1 = 851.0125

Thanks in advance

Rich

Hello;

On Dec 31, 2011, at 10:27 AM, "K3RWN" <rwnewbould@...> wrote:

> I see nothing in the guide which pertains to the PN, I also see UN and CGN, at times, nothing on those either.
>

You can run Unitrunker with the 996XT as an inline signal receiver. Turn on decode logging. The resulting log files will give more meaningful descriptions.

> Also is the Motorola 800 mhz channel chart the same for Type I and Type II systems ?
>

Type I systems may use standard or splinter 851 MHz plans. Type II systems may also use Australia, Red Deer, or Rebanded. The tables overlap. The same channel number and frequency appears in multiple tables. Type II systems may also have Shuffle - which moves the table around in a predictable pattern.

Regards,
Rick

6130. Location Based Scanning

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-13 18:19:51 UTC
From: Fred Halley
Topic: 6129 Message: 6130

I'm having some trouble getting the location based scanning feature to work correctly.

I have an external GPS attached to the scanner and powered up. After a couple of seconds the scanner beeps and displays "GPS" in the upper right of the display. If I set a PIO to a specific lat/lon it does work correctly. Also, if I change the display to the lat/lon it shows the correct coordinates.

The issue is that even if I select a group and set the location and distance that group does not start scanning even though I drive in and out of the designated area.

Has anyone had the location based scanning feature to work on the 396 or the 996?

Thanks
Fred, W2EMS

I use them quite frequently.

Mostly if I hear a call and want to check related radio traffic on another agency, quick and easy. Another plus for me is to be able to go directly to a system group w/out scrolling or other means.

Mine are set up similiar to same channel # on our radios at work...easier to remember.

The others are either numbered according to their line number in ARC-XT software...or by the last digits of frequency. Like 42.260 would be #260.

That's me though. And it works well for me.

Jeff

Number tags as I understand them, can be used to start the scanner in a specific configuration. Say you want to scan systems 1, 5 ,25, and 50. If you assign the same number tag to each of these systems and follow the correct procedure at power-on the scanner will scan the assigned systems. The problem comes when you want to turn off a system or make other changes. At this point you have to shut off the scanner and power it back up to clear the number tag. I don't use this "feature" since I find it to be poorly impelmented.

You're thinking of StartUp keys. Neil and Jeff are correct
in how the System Number Keys and Channel Number Keys work.

From: Lance
Topic: 6129 Message: 6134

Joe,

Neil originally asked about Number tags...

Milton answered but his writing speaks of Start-up keys.

I think someone needs to make a distinction between the two for clarity...

Do you have the "Enable GPS Based Scanning" box checked under the EDIT GPS DATA menu in both the system (If trunked) & group menus and have the quick keys enabled?

I thought I did, but you certainly made some more clarification.

Yes, Milton was thinking of something else (Start-Up Keys).

Joe,

Neil originally asked about Number tags...

Milton answered but his writing speaks of Start-up keys.

I think someone needs to make a distinction between the two for clarity...

Ok. I have used Start-up keys...

I have my systems set up by either geographical location or service (rail, aviation).

Here's my experience,

I'm by the railroad or airport...decide I want to listen to aircraft arrivals or whatever. So I turn it on as I hold the associated Quick-key...

My scanner is then operational as an aviation focused scanner. Instead of going thru the process of turning on and off systems after power up.

To me its like having it start up focused on a specific use.

Jeff

I never used this feature because I was under the impression that once you start using start-up keys, you must always use a start-up key. Is this correct? I love to use this, but I would not like to be forced to use it every time I power up

Yes and no.

If you want to change the set you use for a Start-Up key, you must select the new key on startup. BUT, if you don't want anything to change, you can boot the scanner normally and it will use the last set selected.

You don't always have to press a StartUp key when turning the scanner on.

For example, my 'default' StartUp Key is 1. That's for my local area. When I go to a different area, I use its key (such as 7). When I return, I press '1' on startup and it unlocks my local systems and locks out those in 'area 7'. Normally, I don't use any key, as I'm in my local area and don't need to load a different set of systems.

Did I explain that well?

6142. System/Group numbering order on screen

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-14 20:12:29 UTC
From: Alex
Topic: 6142 Message: 6142

Just a silly question, but why are the system and group numbers on the main screen ordered 1-9,0 instead of 0-9? The scanner uses system numbers 0-99 (there is no system #100) so I would have thought the system number line would start at 0 and end on 9 to match the zero-based numbering.

Like I said, silly question but I ended up thinking about it when I programmed a bunch of system groupings just recently, starting them all at x0 (20, 30, 40, etc.) and on the screen I see the asterisks for 1-4 or so then the blank spaces and the asterisk all the way on the right for what should technically be the "first" system in the group.

6143. RE: [BCD396XT] Startup Keys, Number Tags...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-14 20:15:40 UTC
From: Jerry Mader
Topic: 6129 Message: 6143

SO what you're saying here Joe is that say if i set up my local digital system only on one file, and make that one have a start up key of 1. and upload it, then upload set 2 or start up 2, and let that be say, only the power company, and then upload set three or start up key three's set and make that be the whole 8 systems i monitor then i could just hit a start up key, and it will change each one? or do I have something wrong?
Sorry, lol I'm just wondering.
And lets say, i put a system down as number tag 001. and another system as number tag 002. Could i monitor it quicker by entering the number tag and then hitting hold?
Just trying to figure out the idea behind both features, and how to set up my scanner to start up with just a few systems enabled versus a whole bunch when i just wanna hear the police fire, and the power company for storms and such.
And trying to understand how the number tag system works.
Thanks
Jerry Mader

6144. Quick keys on service ranges

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-14 20:21:30 UTC
From: Alex
Topic: 6144 Message: 6144

I was trying out quick keys on the service scan ranges but I can't seem to activate them by selecting their quick key.

What's the proper use of the quick keys on the service scan ranges and how do I scan the ranges like I would other systems with the quick keys?

>>>And lets say, i put a system down as number tag 001. and another system as number tag 002. Could i monitor it quicker by entering the number tag and then hitting hold?

You would monitor it quicker by just pressing the number key assigned to the system you want...in your example SQK 1 or 2. That scans through the assigned system groups you have activated within that system.

Then if say you have police as channel "32" for example. And it is in system 1...then you press HOLD anywhere during the scan...doesn't matter if the scanner is currently on system 1, 15, or 99....anywhere...just tap HOLD to stop it....and then type in "1.32" + FUNC - as in this example...and it will process it and go to your desired police in channel 32.

Hope this helps...

Subject: RE: [BCD396XT] Startup Keys, Number Tags...

SO what you're saying here Joe is that say if i set up my local digital system only on one file, and make that one have a start up key of 1. and upload it, then upload set 2 or start up 2, and let that be say, only the power company, and then upload set three or start up key three's set and make that be the whole 8 systems i monitor then i could just hit a start up key, and it will change each one? or do I have something wrong?
Sorry, lol I'm just wondering.
And lets say, i put a system down as number tag 001. and another system as number tag 002. Could i monitor it quicker by entering the number tag and then hitting hold?
Just trying to figure out the idea behind both features, and how to set up my scanner to start up with just a few systems enabled versus a whole bunch when i just wanna hear the police fire, and the power company for storms and such.
And trying to understand how the number tag system works.
Thanks
Jerry Mader

Subject: Re: [BCD396XT] Startup Keys, Number Tags...

Yes and no.

If you want to change the set you use for a Start-Up key, you must
select the new key on startup. BUT, if you don't want anything to
change, you can boot the scanner normally and it will use the last set
selected.

You don't always have to press a StartUp key when turning the scanner on.

For example, my 'default' StartUp Key is 1. That's for my local area.
When I go to a different area, I use its key (such as 7). When I return,
I press '1' on startup and it unlocks my local systems and locks out
those in 'area 7'. Normally, I don't use any key, as I'm in my local
area and don't need to load a different set of systems.

Did I explain that well?

6147. Re: [BCD396XT] Quick keys on service ranges

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-14 20:43:35 UTC
From: Jeff
Topic: 6144 Message: 6147

You can just assign a quick key to the desired service search, under Search with Scan...or whatever it says.

If it isn't activating when you press the quick key, then check the lockout status of that service search- under search with scan.

That's the only thing I can figure without looking at it.

Jeff

Subject: [BCD396XT] Quick keys on service ranges

I was trying out quick keys on the service scan ranges but I can't seem to activate them by selecting their quick key.

What's the proper use of the quick keys on the service scan ranges and how do I scan the ranges like I would other systems with the quick keys?

You are close. You would want to make sure you don't erase the previous sets when you upload the next sets.

I use virtually all my SQKs. But, I have other states data in my scanner and I don't want to waste or duplicate any SQKs that I could use for my local systems (local to me is my half of the state).

So, I have SQKs 30-39 and 70-79 that I use for multiple areas. How I keep them separate is using the StartUp Keys. For my area, I hit 1 on startup and it unlocks my local systems so when I enable SQKs 30-39/70-79 I enable the local systems. But, if I hit StartUp Key 7, SQKs 30-39/70-79 become the SQKs for SW OH, for example. If I press 8, that is South Central OH, and 9 is SE OH.

It's a way to effectively "get more than 100 SQKs", as each StaryUp Key provides you with a new set that they enable or disable.

The only down side is that you still scroll through systems that are locked out via the StaryUp Keys. But, that's where System Number Tags come into play - you can go directly to a system using those.

6149. Need help monitoring an Edacs system

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-14 23:33:11 UTC
From: Jerry Mader
Topic: 6129 Message: 6149

Well I need help.
I'm not able to monitor the system for my power company. I did find out that, it's still in operation, but, i just can't monitor it for some reason. I don't know why, but it just won't follow nothing it's silent unless i scan up and down the band, any suggestions?
I would like to monitor this system, it's from what I can tell an EDACS wide system.
But i just don't know.
I can't understand why it won't let me monitor it, i hear the data channel and everything.
But For some reason it just won't grab no traffic off of it. SO what could I be doing wrong.
Had a friend of mine program it for me and even his programming is not working for me so I'm curious if maybe it's my scanner then or what it could be.
Thanks so kindly
Jerry Mader

6150. Re: [BCD396XT] Startup Keys, Number Tags...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-14 23:35:43 UTC
From: MCH
Topic: 6129 Message: 6150

Remember that the Number Tags are used only to go directly to a System
or a Channel. If you want to go to a specific System, you hit it;s
number tag then the MENU button (not HOLD).

If I want to go to the first channel in a System I have tagged 001, I
hit hold (to stop scan), then 001 MENU and it will go to the first
channel on that System.

6151. RE: [BCD396XT] Startup Keys, Number Tags...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-14 23:36:11 UTC
From: Jerry Mader
Topic: 6129 Message: 6151

I guess i still don't quite understand this. I'm so sorry.
Like how do i set up start up keys in Free Scan. and also how do i make sure that all systems are locked out on start up key 2 accept the digital system and the consumers energy system once i get it working right lol.
Thanks guys.
Jerry Mader

From: BCD396XT@yahoogroups.com [mailto:BCD396XT@yahoogroups.com] On Behalf Of MCH

Subject: Re: [BCD396XT] Startup Keys, Number Tags...

You are close. You would want to make sure you don't erase the previous sets when you upload the next sets.

I use virtually all my SQKs. But, I have other states data in my scanner and I don't want to waste or duplicate any SQKs that I could use for my local systems (local to me is my half of the state).

So, I have SQKs 30-39 and 70-79 that I use for multiple areas. How I keep them separate is using the StartUp Keys. For my area, I hit 1 on startup and it unlocks my local systems so when I enable SQKs 30-39/70-79 I enable the local systems. But, if I hit StartUp Key 7, SQKs 30-39/70-79 become the SQKs for SW OH, for example. If I press 8, that is South Central OH, and 9 is SE OH.

It's a way to effectively "get more than 100 SQKs", as each StaryUp Key provides you with a new set that they enable or disable.

The only down side is that you still scroll through systems that are locked out via the StaryUp Keys. But, that's where System Number Tags come into play - you can go directly to a system using those.

Topic: 6129 Message: 6152

1.32 + MENU (not FUNC).

Joe M.

Jeff wrote:
>>>> And lets say, i put a system down as number tag 001. and another system as
> number tag 002. Could i monitor it quicker by entering the number tag and

>
> You would monitor it quicker by just pressing the number key assigned to the system you want...in your example SQK 1 or 2. That scans through the assigned system groups you have activated within that system.
>
> Then if say you have police as channel "32" for example. And it is in system 1...then you press HOLD anywhere during the scan...doesn't matter if the scanner is currently on system 1, 15, or 99....anywhere...just tap HOLD to stop it....and then type in "1.32" + FUNC - as in this example...and it will process it and go to your desired police in channel 32.

Subject: [BCD396XT] Need help monitoring an Edacs system

Well I need help.
I'm not able to monitor the system for my power company. I did find out that, it's still in operation, but, i just can't monitor it for some reason. I don't know why, but it just won't follow nothing it's silent unless i scan up and down the band, any suggestions?
I would like to monitor this system, it's from what I can tell an EDACS wide system.
But i just don't know.
I can't understand why it won't let me monitor it, i hear the data channel and everything.
But For some reason it just won't grab no traffic off of it. SO what could I be doing wrong.
Had a friend of mine program it for me and even his programming is not working for me so I'm curious if maybe it's my scanner then or what it could be.
Thanks so kindly
Jerry Mader

Subject: Re: [BCD396XT] Startup Keys, Number Tags...

You are close. You would want to make sure you don't erase the previous sets when you upload the next sets.

I use virtually all my SQKs. But, I have other states data in my scanner and I don't want to waste or duplicate any SQKs that I could use for my local systems (local to me is my half of the state).

So, I have SQKs 30-39 and 70-79 that I use for multiple areas. How I keep them separate is using the StartUp Keys. For my area, I hit 1 on startup and it unlocks my local systems so when I enable SQKs 30-39/70-79 I enable the local systems. But, if I hit StartUp Key 7, SQKs 30-39/70-79 become the SQKs for SW OH, for example. If I press 8,

that is South Central OH, and 9 is SE OH.

It's a way to effectively "get more than 100 SQKs", as each StaryUp Key provides you with a new set that they enable or disable.

The only down side is that you still scroll through systems that are locked out via the StaryUp Keys. But, that's where System Number Tags come into play - you can go directly to a system using those.

I'm very sorry about that.
It's Saginaw county. It's Saginaw city and Michigan for the state.
I'm sorry about that.

6156. Re: [BCD396XT] Need help monitoring an Edacs system

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-15 00:40:42 UTC
From: Ronski45
Topic: 6129 Message: 6156

Jerry, make sure you do get a signal as Im sure you do off the Saginaw
tower.

Since I programmed yours, I have found I took out three frequencies.
Consumers I have found once in awhile has switched up somewhat as far as
LTR #'s.

Go ahead and delete these-
freq: ltr:
855.1625 7
859.4125 8
860.4125 9

Once done you should have a total of 10 frequencies.
The first six frequencies are for the Consumers saginaw tower, the last
4 are the Gratiot county tower.
When I did it although I dont routinely scan consumers all the time it
is working fine here.
If you still have some trouble, try locking out the 4 gratiot tower
freqs, since your more apt to use the saginaw tower.

For reference heres the consumers setup -
http://www.radioreference.com/apps/db/?sid=1579

My website http://webpages.charter.net/radiosite/MidmichiganScanner.html

6157. Re: [BCD396XT] System/Group numbering order on screen

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-15 02:01:51 UTC
From: Jeffry Rehm
Topic: 6142 Message: 6157

Just a quick reply. I also thought it was odd. Especially when you are trying to pick out a syatem and right after 19 you have to look for 10, not 20. Odd for sure.

Just a silly question, but why are the system and group numbers on the main screen ordered 1-9,0 instead of 0-9? The scanner uses system numbers 0-99 (there is no system #100) so I would have thought the system number line would start at 0 and end on 9 to match the zero-based numbering.

Like I said, silly question but I ended up thinking about it when I programmed a bunch of system groupings just recently, starting them all at x0 (20, 30, 40, etc.) and on the screen I see the asterisks for 1-4 or so then the blank spaces and the asterisk all the way on the right for what should technically be the "first" system in the group.

This also was an odd programming function. I tried for months to get a search group (ie; railroad) to a quick key but just could not get it to work. Tried again just a few weeks ago for the heck of it and with the step by step instructions right in front of me got it to work ... some how.

You can just assign a quick key to the desired service search, under Search with Scan...or whatever it says.

If it isn't activating when you press the quick key, then check the lockout status of that service search- under search with scan.

That's the only thing I can figure without looking at it.

Jeff

I was trying out quick keys on the service scan ranges but I can't seem to activate them by selecting their quick key.

What's the proper use of the quick keys on the service scan ranges and how do I scan the ranges like I would other systems with the quick keys?

There IS a reason for it, but I can't remember what it was! :-\

Maybe it was because keyboards start with the 1 and not the 0. That doesn't spark a memory, so that likely was not the reason, but I do remember that Paul Opitz mentioned it back in the early BC396T days.

Date: 2012-01-15 08:45:05 UTC
From: Alex
Topic: 6144 Message: 6160

I did assign the quick key but it doesn't search.

I've got quick key 51 assigned to the Air service search. I turned off all the systems that I have programmed using their own quick keys. At this point the radio says "Nothing to Scan" as it should. Then I activate quick key 51 which I thought should start the scan on Air service. But instead it just sits there with "Nothing to Scan".

I'll check the lockout and see if it's that. It probably is though I don't recall locking out those services.

Don't forget to enable SEARCH WITH SCAN.

6162. Help with an EDACS system

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-15 12:38:06 UTC
From: Jerry Mader
Topic: 6162 Message: 6162

Hey folks.
Ok well I took out some frequencies they didn't use any more, and then i tried to upload that one system all by its self. It hears the control channel but when i hit the scan button it gives me a three beep sequence and I'm not sure what the display is saying, I'm totally blind.
But why wouldn't it let me scan it if everything is not locked out, and all keys are enabled.
Does anyone have any ideas?
Jerry Mader

Yes, they are both checked and the correct lat/lon and range entered. Still not scanning.

Do you have the "Enable GPS Based Scanning" box checked under the EDIT GPS DATA menu in both the system (If trunked) & group menus and have the quick keys enabled?

How far into the programmed range are you? My experience in the Los Angeles area using the Uniden GPS puck with my 396xt is there is about a plus or minus one mile tolerance relatve to the programmed range ... in other words sometimes I'll be as much as a mile into a programmed range before the gps unlocks that group and sometimes I'll be as much as a mile outside a programmed range and the gps will unlock that group ....

I'm going to guess that you have a very large number of tagged things set in your configuration. Location is quite precise (every day my systems turn on/off within 100 feet of the same location, which is always right at the set points).

If you have a lot of locations set, then it can take some time for the scanner to work through all of them, which could result in what you are reporting. Location calculations are all performed secondary to scanning activities.

Yes I can send you the file I have I gave you before in the the with the
channels deleted I mentioned. Trying to think what those beeps are?
Should have someone who is sighted take a look at the display on the
scanner, see what it says.
IMO though it might be displaying 'Nothing to scan' ou dont have any
systems enabled. I just tried it on mine and it had 3 sounds.

From: Fred Halley
Topic: 6129 Message: 6169

Actually, I have very few tagged items set. The few I have tagged are really for testing so I can understand more about how to setup location based scanning. I have had success with setting a PIO and the scanner alerting me so I assume (maybe a bad idea) that the GPS is setup correctly and sending accurate data to the scanner. I can also change the GPS display to show lat/lon and it shows my location and changes as I drive around.

I attached a couple of screen shots to a recent post that may help see where I'm at with this project.

Thanks

Fred, W2EMS

6172. RE: [BCD396XT] Re: Location Based Scanning

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-16 12:56:21 UTC
From: Clayton
Topic: 6129 Message: 6172

You may want to double check your location info and range in that group. The most common error I make is forgetting to make the longitude negative (west), which obviously never unlocks the group. (I don't go to China with my scanner :)

If you are seeing the "GPS" icon in the display, and it shows your position when you switch the display to GPS, then you're getting the GPS info to your scanner. If the group never unlocks, I would say your coordinates or range is wrong. If it is never locked out by GPS, I would say you don't have GPS enabled for that group.

Clayton

6173. Looking For Someone,To help me program my scanner

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-16 16:21:57 UTC
From: mrmullucan
Topic: 6173 Message: 6173

Hi I bought my BCD396XT Two years ago. I bought cd to program and subscription to radio reference it has run out need to renew,I live in seminole county FLA.I was hoping someone here lives close and can come help me put scanner groups in the right place.I own a really great scanner,and would love to have it do what it is set to do,I love getting the news as it happens.Thank You

6174. BCD396XT Loudness

Topic: 6174 Message: 6174

Does the BCD396XT sound really loud sometimes when certain radios broadcast using P25?

I have a 396XT and a GRE PSR500. I compared my 396XT to my GRE 500 and the PSR-500 audio is always constant and doesn't vary or get loud like the 396XT does. I have played with the AGC on the 396 but no matter what, I cannot get a nice constant audio level across all the talkgroups on the Westmoreland County PA P25 system.

Anyone else experiencing this on the 396XT?

I don't have that problem on my 396XT or 995XT monitoring the same system. Are you sure you were adjusting the correct AGC (the digital one)? Although the system itself uses AGC so the levels should be the same coming out.

I also have the same problem on P25 systems. I do not believe it is the scanner. It is the P25 system(s) and the equipment they use and the inherent problems with "digital". Sometime on a system with multiple dispatchers a few will be real loud and a few others will be so soft that even at 15 on the volume you can't hear them. Goes the same for the mobile units. Some you can't hear at all and others have you running for the volume knob. But for the most part they are pretty well even with volume.

Gidday All,

I monitor the digital NSW GRN (New South Wales Govt Radio Network - Motorola) here in Australia, and the audio is all over the shop.
I don't know weather it is the scanner or the techs who don't know how to properly install and tune the network.

I still prefer myself a good analogue system. You can get analogue down to 6.25kHz bandwith now, so the arguement of saving spectrum
of digital doesn't apply.

Regards,

Doug VK2XLJ

Yes, my digital AGC is set and I also played with the response times and gain settings. Do you listen to TG 52? One of the units on that TG is very loud. If I set the volume to a level of 3 one of the units comes in VERY loud & the base is very soft. Also noticed several fire units with the same issue. When I listen on the PSR500, the levels are even.

Is your digital AGC on? What is your ref gain & time set at?

I haven't yet given my 396XT a go on digital, that's waiting for the CFA to migrate to P25. The only digital experience I have is with D-STAR (on ham gear), where audio levels have been very consistent. I prefer digital audio. It's not as "natural" sounding, but I find it generally easier to copy. However, I do have concerns about black spots, which analogue at least gives a warning of (by means of a noisy signal).

Not sure which question your are asking, so I'll try both:

1) If the channel uses a NAC and you want to limit reception to transmissions only including that NAC then you need to program it.
2) You can program the NAC using either the PC or when you manually program the channel. It is a channel attribute in either case.

Just to see if you did get my two emails I sent to your gmail account that included the newer files for your radio? I didnt hear back from you is all.

If you did get them both use the second one as it is more up to date.

Hi

Thanks for getting back to me. I tried to put in a NAC number and it wouldn't let me I got a drop down list and the one I had was not on it. This is a real pain.

6185. Should have bought the "Stupid Person" Insurance

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-20 01:04:51 UTC
From: M E
Topic: 6185 Message: 6185

Hello all
My wife bought this for me for Christmas. It came fully programmed and ready to go. Of course I (Stupid Person) had to play with everything and now it seems that I can no longer pick up the Police channels in my town (Bayonne NJ) and the next town over (Jersey City NJ) The Fire Departments are coming in loud and clear but I can't get the Police. Any help would be appreciated before I have to pack it up and send it back for them to reset it. Thanks in advance.

Contact me off the list directly, I'm in Illinois but I am very familiar with the XT line of scanners and own many. If you want also include a number and time to give you a call as trouble shooting things like this over the phone is just easier. I have helped many people and am confident I can help you too. I don't charge anything for my help just knowing I am helping a fellow hobbyist is its own reward. Any way hope to hear from you.

Have a good night,

Bob

What is the NAC?

I can't believe anyone would use a dropdown list
for NACs since there are 4095 possible NAC codes.
And since they are continuous, I bet you were
looking at something else, and not the NAC list.

Check the Group Quick Keys for that system. That would be the bottom set
of numbers. If any have a * in place of the digit, hit FUNC then that
number to re-enable it.

6189. RE: [BCD396XT] Programming P25 using Butel ARC system

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-20 04:26:20 UTC
From: Robert Klamp Jr.
Topic: 6181 Message: 6189

There is no drop down box for NAC codes, just set the audio type to digital and enter the NAC in the cell to the right of it. If you are trying to enter a NAC using the PL/DPL drop down box that will not work you have to enter the NAC value there is no drop down box for it when using ARC-XT.

Hope this helps,

Bob

Hello group,

I plan on buying this radio in the next 2-3 weeks. I will also be needing some software. I haven't used Uniden scanners since my BC780. I loved the Butel software, but I'm sure things have changed. I'd appreciate any advice, input or suggestions. Thanks! :)

They all have trial periods so you can try them and see which you like.

There is a list of supported SW on the RR XT WIKI.

NAC, not KNACK.

You know, as in Nic-NAC paddywhack, give the dog a bone.
(I know, that is really Knick-knack)

But, I don't have the NAC Lance does when it comes to humor.
(yes, I know that too is *knack*).

I had another few more, but I self-edited it to keep the post 'family
friendly'. Let's just say I never realized how perverted that kid's
rhyme really is!

OK. I'm done being silly (for now).

I guess the only true NAC is Network Access Code. :-)

Regardless, hopefully John has found the error.

Gidday Bob,

Good to see there is still the good spirit out there to help others for free. Thats what a hobby is all about....share the knowledge.

Just as a note for everyone, these scanners are very complicated for even seasoned scanner enthusiasts when they first get them.

The best thing I did was download the program "freescan". If your scanner is working perfect, you can download the profile and save it.
If you stuff it up while playing around with it you can restore it back.
This program really saves a lot of time when programing freqs and names as you can use the computer keyboard and not the limited buttons
and dials on the scanner.

Regards,

Doug VK2XLJ

Hi all, I want to buy the original antenna BATG0469001 for my scanner (I lose it). I'm from Barcelona (Spain), and there is not Uniden's deleader here who want`s sale accesories.
I'm loocking for suppliers from U.S.A. but I can´t find any one who ships items to Spain.

I can pay ussing Paypal or VISA credit card.
Do you know any shop to buy it?
The Uniden online store is not friendly for me, my country is not at the states list, for make the order.

Thank you all in advance

Mario

I just bought a BC396XT. So far I like BUTEL the best, it seems to work well. The quick keys and groups didn't play nice in FREE SCAN. But im using the trials still on all of them. They are really user friendly and you can download full systems from Radio Reference through the software directly, it saves on the fingers for programming. You just need to have a premium account.

Has anyone tried running rechargeable lithium Ion batteries in their BCD396XT? I just started looking for a few different kinds and im not sure how much the voltage would impact the unit. The lithium ion batteries are 3.2v and the Nickel Metal Hydride ones are 1.25v. The Li-Ion batteries are 3200mah and should last longer, plus they are lighter too.

Any thoughts?

Mike-KC9NSA

>>>>> Could you please explain why Lithium Ion batteries are bad for the 396 or 396XT? I have used lithium Ion Batteries in my Motorola equipment for the last couple years and love them they are lighter, stronger, and last longer with that said I have no knowledge of the voltages or how the electronics physically work so I ask because I would like to know how the Lithium Ion Batteries would affect the scanner or any of its components. I have been looking into Rechargeable Lithium Ion batteries for a while now but just have not been able to find any. Of course I would never charge anything in the scanner as I know the problems that can cause so I would use a external charger but as far as just using them to operate the radio I would think that it would be O.K. In short I would just like to know what problems or damage could be caused by using them in your radio? Also Mr. Sigler where did you find the rechargeable Lithium Ion AA batteries I have been looking for a while and have not been able to find true lithium ion AA's?

Thanks For any answers,

Bob

It's not the chemistry though the internal charger is not made for Lion. The unit is made to operate on 5-6VDC not 13V.

6206. RE: [BCD396XT] Li-ion Batteries

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-01-22 04:53:05 UTC
From: Robert Klamp Jr.
Topic: 6201 Message: 6206

So if you use them will you get a Illegal Voltage screen like you do if you plug it into the wrong power supply or will it simply just overload and fry the radio. Thanks for taking the time to answer my questions by the way electrical theory isn't my strong suit.

Thanks again,

Bob

3.2 x 3 = 9.6VDC

Not sure the radio is designed for that voltage. Would have to look at the specs.

Where did you find rechargeable Lithium Ion Batteries in an AA form factor?

These batteries no good. One is too low (3.2V). Two is too high (6.4V).. Stick with Alkaline or Ni Mh.

http://www.batteryjunction.com has a large assortment of batteries. They have regular Li-Ion Energizer ultimate's and those are 1.5v each, so its 4.5v and should be fine. The Ni-Mh are 1.2v each x3. The wall adapter puts out 6v, so the scanner can handle that much. Im still searching, but hopefully I can find 1.5 Li-Ion rechargeable.

I have never tried in my scanner, but you can buy dummy cells so you can use 2 of the higher voltage cells vs 4 of the 1.25 v ones

Are Lithium Ion batteries available in standard sizes like AA , C or D cell size?

No, Lithium-ion batteries are not available in standard sizes. We believe this is because it would be too easy for users to inadvertently put them in a charger not designed for Lithium-ion batteries creating a potentially dangerous situation. (If an alkaline battery is put into the wrong charger it might leak or even burst, but a lithium-ion battery put into a NiCd or NiMH charger not designed for lithium-ion, might ignite. Also, because Li-ion batteries operate at much higher voltage (typically 3.7V per cell) than the 1.2 to 1.5V of most cell batteries, designing a 1.5V lithium-ion cell would be expensive

From: Jamie Hanrahan
Topic: 6201 Message: 6216

Unfortunately the terms "lithium" and "lithium-ion" are confusing and are often confused, in conversation and even on suppliers' web sites.

Lithium AA cells are 1.5 volts, and are not rechargeable. The Energizer Ultimates are of this type.

Lithium-ion cells are 3.6 volts, and are rechargeable. Last I heard, they were not available in AA size. That was done deliberately so that people would not be able to put the in places intended for AA. They are also not really intended for direct consumer use. They are intended to be assembled into packs with temperature sensing and other circuits, with the packs used only in gear (like laptops and mobile phones) that knows not to try to discharge them too far and provides the charging circuit. Temperature monitoring is an important part of the charging regime for Li-ions.

The most common small Li-ion cell is the 18650 - these are used in a great many laptop battery packs and also in the Tesla roadster. If you wanted to try using these in your 396XT, I'd think your easiest method would be to use two of them in series and then use a 1N4001 diode or three to get the voltage down to what the scanner expects. The diodes will also protect the cells against charging when the scanner is connected to a power adapter.

It will be a little bulky as 18650's are not only longer than AAs, but also slightly larger diameter. I don't know how you'd arrange to charge them, either - just try to find a charger for "loose" 18650's. And if you discharge them too much you'll never be able to charge them again. They have an internal electronic fuse that will open, as attempting to charge them in that state can cause the cell to catch fire. (Laptops and other devices intended to be powered from Li-ions will do a forced power off before the cells in the pack reach this point.)

Just buy the Maha or Sanyo low-self-discharge NiMH cells, and do NOT charge them in the scanner - these scanners use a "dumb" timed discharge circuit. Maha also makes great chargers.

Ok, "last I heard" was not recent enough! batteryjunction.com does have Li-ions in AA size.

BUT! They're still 3.6 volts.

And unlike the lithium primary batteries, they're only 900 mAh per cell. At 3.6 volts (assuming constant V over the useful discharge interval) that's just 3.24 watt-hours. Compare to a good current NiMH, only 1.2 volts but 2500 mAh - that's 3 watt-hours. And with NiMH you get to use three of them, for 9 watt-hours total. Even if you used three of the Li-ion AAs and an efficient "bucking" voltage converter to take care of the excess voltage, you'd have less than a 10% improvement in watt-hours. I doubt it would be worth the trouble.

From: Neil
Topic: 6219 Message: 6219

A Friend of mine bought a 396XT and I used Freescan to set up the systems he wanted. He is happy with that but has a question I don't immediately know the answer for since I don't use Direct entry - all I want to listen to is programmed in with Freescan.

If someone gives him a frequency and he just wants to try it out and listen to it without actually programming it into his scanner - is that possible? He was up in Oregon and a relative gave him the frequency of a local Police department.

So what is the easiest way for him to key that into the scanner and just listen to it for a short while??

Hey i had this question for you.
I am having trouble with turning on and off system keys vs. group keys.
How do i turn off and on system keys 10 through 99, and how do i turn on and off group keys in a system from 1 to nine?
I don't understand how to do these.
Could someone help me here?
Do i have to hold on a system to turn on/off a group's quick key?
And when is the function key used for these two scenarios?

6225. UID's & I-calls

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-03 19:10:49 UTC
From: Jeff
Topic: 6225 Message: 6225

Does UID feature need to be enabled to capture I-calls or "private calls" on Motorola type II analog systems, when in ID search mode or when i0 wildcard has been entered?

Thanks,
Jeff

NO, ICALLS come up automatically if the system your hearing uses that feature....

6227. HAM Radio Repeater Reception

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-03 20:23:10 UTC
From: Richard
Topic: 6227 Message: 6227

Hello,

I can't seem to figure out why this would happen.
But when I scan a Ham Radio Repeater frequency I can get almost the entire conversation, but then squelch kicks in and blocks a couple of seconds of it then opens up.

I confirmed the frequency had no PL Code.

Any ideas what is causing this?

BTW I turned squelch all the way down to zero and still no luck.

Second question, which may be the fix ... Is there a way to open up squelch on a channel? I mean, just open and listen static and all?

Thanks in Advance.

The radio is either "Band passing" so change the RX mode from NFM to FM, or do you have priority set to "on" ? This would make the radio sound like it is muting for a moment...

Not sure what this has to do with UIDs and I-Calls, and not really sure
what you are asking, but...

The discriminator is not blocked. By its nature it is providing
audio that the scanner is receiving without any filters at all.

If you're asking how to unblock encryption, you cannot. The scanner
cannot decode encrypted audio. No scanner can, in fact. (by law)

If you set the squelch to 0 and you did not hear squelch noise, you definitely have some form of coded reception active. When you are monitoring a frequency CSQ, you can hear the squelch noise when you drop to 1 or lower.

I would agree with the other posts. Ham repeaters should be set to FM in 99.9999% of the cases (there are only maybe a dozen SNFM ham repeaters nationwide). I think there are more P25 ham repeaters than SNFM.

Also make sure Close Call, Channel Priority, and Weather Priority are disabled (or on DND mode in the case of Close Call).

You could also have another carrier near the frequency that is causing
the issue and blocking the squelch from opening fully.

Wow, Thank you everyone for the fast response.
It was the Close Call, WX and Channel priority causing the "pause" in rx.

Just for good measure, I also changed the modulation to FM.

Thanks Again.

If you are HOLDING, then it will do the search key function. If you are
SCANNING it will turn the channel group on/off.

6240. Battery Charge Time

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-04 05:53:03 UTC
From: Richard
Topic: 6240 Message: 6240

On Average ...
How long do you notice it takes to charge the 2300mah batteries in the unit.

Does anyone know what the charge rate is when the unit is turned off, and when the unit is turned on?

The default 14 hr charge time seems too long.

Thanks in advance.

If you have them all set to SQK 0, it will enable/disable all three at
the same time. (you could say kill/revive, I guess) ;->

Be careful using SQK 0, as it is 'reserved' for race car functions in
some units.

About 14 hours.

> Does anyone know what the charge rate is when the unit is turned off, and when the unit is turned on?

Not offhand, but it is the same. The wall wart has enough power that using the scanner does not tax the charge current.

> The default 14 hr charge time seems too long.

Nope. It's dead on the standard charge rate. If you want a faster charge, you can do what I and many others do - buy a rapid charger that can charge the cells in as little as an hour or so. But, such units have circuits that are designed for rapid rate charging. The 396 does not. They will also do something else the 396 cannot - optimize each cell and fully charge the cells without overcharging them.

Translation: It's really not a good idea to use your scanner to charge cells. Buy the dedicated NiMH charger that charges the cells individually. I like the Maha brand, but there are several good ones out there.

What do you mean by that?
I'm using the Bcd396xt.
But i don't understand what you mean by it's used for racecar functions.
sorry.
But anyway yeah that's what i did wanna know.
Also Joe if you or anyone else could tell me, if I uploaded say a file with a bunch of systems and set that to start up key 1. and then loaded a different configuration and set it to start up key 2. would this let me kill one configuration which would have the channels in the default, of 1. And load the new start up two config or is this totally something different altogether.

Subject: Re: [BCD396XT] Quick keys for system/groups

If you have them all set to SQK 0, it will enable/disable all three at the same time. (you could say kill/revive, I guess) ;->

Be careful using SQK 0, as it is 'reserved' for race car functions in some units.

I used it to recharge my batteries for the first month or two. I never went over 12. What I did was plug it in when I went to bed and set it to charge for how ever many hours I would be sleeping. Seemed to always get through the next day like that.

I use an external charger now, and same batteries still going strong 8 months so far..

On Average ...
How long do you notice it takes to charge the 2300mah batteries in the unit.

Does anyone know what the charge rate is when the unit is turned off, and when the unit is turned on?

The default 14 hr charge time seems too long.

Thanks in advance.

No problem. SQK 0 is used in some models (such as the BR330t) for race car functions. As such, it is not available and there could be some compatibility issues if you or someone else tried to use your file in such a scanner.

> But anyway yeah that's what i did wanna know.

> altogether.

Well, you would need to load them both at the same time unless you are not erasing the contents on the second write.

Using the different Start-Up keys allows you to duplicate the SQKs without slaving them together. Without the Start-Up key difference, enabling one would enable them all. With the Start-Up key, all the ones assigned to a different Start-Up key would be locked out and not enabled when you enable that SQK.

Clear as mud? It's not that easy to explain (especially at 1 AM).

Joe M.

Sorry for not understanding this all the way, I can't comprehend too well. I apologize, but what I'm trying to do and maybe you could tell me how I'd do this for example is have 2 systems.
A winter start up configuration and a summer one.
With startup key 1, i would have all my winter systems that i listen too in the winter on start up key one.
Then when i hit startup 2 all of those would be disabled and the summer config with the summer oriented systems and talk groups would be enabled and the winter one would disappear until winter again.
But for this I'd need to upload 2 sets of the same systems right, can I do that or will it mess up the scanner?
Reason I'd need to do that is that set one would contain all of my winter systems and some of them will be duplicates, such as police and fire and such. But then it would also add in the school buses, and plow trucks and stuff. With system two i wanted to be able to upload that one under start up 2 and that one would have still the groups for the state police things like that as system one would have, but would turn on the parks, and recreations, and sky warn repeaters and stuff like that.
How would i do this so it would work the way I'd want it to do so? Or can't I do this at all?

I have maha smart charger -
http://www.newegg.com/Product/Product.aspx?Item=N82E16817355012
for AA's and normally it takes maybe an hour, a max of 2 hours to charge each cell, so accordingly I set the radio for 1 or 2 hours. Batteries - energizers, have been fine.

You have the concept down. That's exactly one way it could be used.

> But for this I'd need to upload 2 sets of the same systems right, can I do
> that or will it mess up the scanner?

You can do it with two uploads AS LONG AS you don't erase the scanner
contents when you upload the second set. You can also upload both at the
same time.

> Reason I'd need to do that is that set one would contain all of my winter
> systems and some of them will be duplicates, such as police and fire and
> such. But then it would also add in the school buses, and plow trucks and

> How would i do this so it would work the way I'd want it to do so? Or can't
> I do this at all?
> Jerry Mader

What you want to do is possible and would work very well. Just make sure
your winter systems are assigned Start-Up Key 1 and your summer systems
are assigned Start-Up Key 2. You can upload them both at the same time.

Using them is simple. When you want to unlock your summer systems, hit 2
when the scanner is powering up. When you want to unlock your winter
systems, hit 1 when the scanner is powering up.

Any system not assigned a Start-Up Key will not be affected by the
reconfiguration, so you could have a THIRD system with your common
channels and assign that no Start-Up Key, and remove them from both of

the other systems.

Basically, the Start-Up keys are mass-lockout/unlock commands. Only the systems assigned to the Start-Up key pressed will be unlocked, while ALL OTHER systems assigned different Start-Up Keys will be locked out.

Funny how much easier it is to explain in the morning as opposed to 1 AM at night. ;->

I'm assuming you have a large number of Systems that you want changed by the Summer/Winter configuration. If not, it might be easier to use a System Quick Key to enable or disable them. That way, you could easily enable both of them if you like.

Sure you want to listen to that noise all day?

My friend has the Pro-106, and frankly, it's really annoying...

For me, I'm glad this radio mutes encrypted traffic...

I would imagine that is coded in firmware that drives the radio so to speak, so probably not within our reach to modify...

I have the Maha MH-C401FS.

Charges 1 to 4 cells. So perfect for this radio (3 cells).

Can fast charge or slow charge.

This by far the best charger I have purchased...

That's fine, but the point is that some models reserve SQK 0 for special
functions, so in those models SQK 0 would not do the same thing it does
in yours.

You mean like the BR-330T with the Nascar Logo. Cool radio with it's coverage, horrible display...

Off topic, but "That's Fine"

Cheers Joe,

6255. RE: [BCD396XT] Quick keys for system/groups

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-05 07:46:09 UTC
From: Jerry Mader
Topic: 6221 Message: 6255

Hey I have free scan and i kind of need help.
I have to go in and label the combo boxes as they don't speak well with my screen reading device.
I need them to say what I'm changing in them like for example, when i go to system quick key i need to know that that's the box I'm changing not the dropdown for the delay.
Could someone help me off list with this?
MY email is Management@...
I'd greatly appreciate it.
I just need to verbally talk to someone on skype or on the phone while in upload and download so i can understand what I'm looking at so to speak as a quick fix.
The long way around it is, that, I'm trying to build some scripts for jaws for windows a screen reading software for this software too.
A great friend of mine could do this but I don't know how to contact the developer to have him help my buddy write the software to work with the scripts for me to make this easier to use.
Yes blind friendly mode is nice, but the program has to be relabeled and stuff for the combo boxes and check boxes, radio buttons, edit fields ETC. which my friend could help with too at no charge. He's a great programmer and does wonderfully on jaws for windows scripting for the blind.
Thanks
Jerry Mader

You have the concept down. That's exactly one way it could be used.

> But for this I'd need to upload 2 sets of the same systems right, can I do
> that or will it mess up the scanner?

You can do it with two uploads AS LONG AS you don't erase the scanner
contents when you upload the second set. You can also upload both at the
same time.

> Reason I'd need to do that is that set one would contain all of my winter

> I do this at all?
> Jerry Mader

What you want to do is possible and would work very well. Just make sure
your winter systems are assigned Start-Up Key 1 and your summer systems
are assigned Start-Up Key 2. You can upload them both at the same time.

Using them is simple. When you want to unlock your summer systems, hit 2
when the scanner is powering up. When you want to unlock your winter
systems, hit 1 when the scanner is powering up.

Any system not assigned a Start-Up Key will not be affected by the
reconfiguration, so you could have a THIRD system with your common
channels and assign that no Start-Up Key, and remove them from both of
the other systems.

Basically, the Start-Up keys are mass-lockout/unlock commands. Only the
systems assigned to the Start-Up key pressed will be unlocked, while ALL
OTHER systems assigned different Start-Up Keys will be locked out.

Funny how much easier it is to explain in the morning as opposed to 1 AM
at night. ;->

I'm assuming you have a large number of Systems that you want changed by
the Summer/Winter configuration. If not, it might be easier to use a
System Quick Key to enable or disable them. That way, you could easily
enable both of them if you like.

6256. I need help using freescan, i'm totally blind.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-06 19:03:29 UTC
From: Jerry Mader
Topic: 6221 Message: 6256

I have a few questions.
And i really need help here. I don't mean to go off topic and I'm sorry if I am.
But I'm trying to work on this with absolutely no sighted help, so the more help I can get the better.

IN the site dialog on free scan, when you're modifying a site, under the quick key tab is where i am.
And well i have the quick key labeled right that's right after the place that you'd put the name of the site you're setting up. SO i have that box set to read "quick key" when i land on it.

See, I'm using my tab key, i can't use a mouse at all because Jaws For Windows won't read mouse usage, it only uses the keyboard.
Then there is the locked out box to check if you wanna kill the whole site.

Then after that box, there's the Modulation box, that has like fm, auto and narrow fm things like that. Then, there's another box, labeled that box, and that's right after the modulation box.
Then there's a 20 db attenuation check box, now I'm up to another control box i don't know what it does.
It's right after the box which i labeled that is for the type of trunking system you want to set the site for. It's, a box that has the options, 0 to 255 what am i setting in that control drop down?
Now after that I've got a box, and in it it has a 0 to 9 dropdown and right now it's got a . in it. What is that box for?Then after that box, there's a few buttons that are unlabeled and then there's the find free button. Then right after that is the box that's for the site time hold time, and after that box i see the place to set the hold time if i were to set that pervious box to manual.
Then i see the P25 digital wait time box. After that is the state box. and it's set to off. then i go back to the system's tree view.
SO what are those controls that I don't have marked yet? Would someone kindly let me know? just press your tab key and move around the screen using the Tab key,, I'm using the tab and shift tab mainly to get around.
So if you'd greatly thread this and tell me what I'm looking at I'd appreciate it so much, because then i could use this with out a problem and be able to do as you who are sighted can do.
Thanks for all of your kind help it's very much appreciated.
Jerry Mader

Then after that i see this other box, and it goes from 0 to 9.
Thanks

On my Free Scan, under the P25 site, the tab order is:
Site Name
Quick Key
Locked Out check box
Modulation
20dB Attenuation
Site Type (P25 Standard is default for a digital system)
The Next one is Hold Time 0-255
Then, you have the Startup Key (with the . in it)
The next three boxes are justification (Right, Centre, Left) for the site label.
Then Find Free (which finds the next unused Quick key)
Then APCO Mode
Then Threshold
Then P25 Wait Time
Then State (USA)

can't
> I do this at all?
> Jerry Mader

What you want to do is possible and would work very well. Just make sure your winter systems are assigned Start-Up Key 1 and your summer systems are assigned Start-Up Key 2. You can upload them both at the same time.

Using them is simple. When you want to unlock your summer systems, hit 2 when the scanner is powering up. When you want to unlock your winter systems, hit 1 when the scanner is powering up.

Any system not assigned a Start-Up Key will not be affected by the reconfiguration, so you could have a THIRD system with your common channels and assign that no Start-Up Key, and remove them from both of the other systems.

Basically, the Start-Up keys are mass-lockout/unlock commands. Only the systems assigned to the Start-Up key pressed will be unlocked, while ALL OTHER systems assigned different Start-Up Keys will be locked out.

Funny how much easier it is to explain in the morning as opposed to 1 AM at night. ;->

I'm assuming you have a large number of Systems that you want changed by the Summer/Winter configuration. If not, it might be easier to use a System Quick Key to enable or disable them. That way, you could easily enable both of them if you like.

There is a Freescan Yahoo Group.

You might have a wider audience of users their to help you...

I was just using Freescan to add a system to my 396XT, using the cable supplied with the scanner in the box, and when I was done the damn port came out of the scanner with the cable! Now what do I do? It looks like a simple drop of glue *might* fix it, but I'm loathe to try it. Has this happened to anyone else? How did you fix it? Did you send it back to Uniden to be repaired? How much did it cost?

Uniden usually charges $49 for out of warranty items. If its fairly new still, its probably under warranty and free to have fixed. I think you only pay shipping.

Do NOT glue it! Using the wrong glue WILL destroy the case! And do not assume a glue for plastic will work on all plastics. Testing various glues on plastics I have found some make the plastic literally melt, others make the plastic brittle and break apart with very little pressure. Best bet it let Uniden fix it!

6265. BCD396XT Battery Charge Rate Draw Rate

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-08 18:15:43 UTC
From: Richard
Topic: 6265 Message: 6265

I just wanted to post this for everyone, since it was not listed anywhere, and after calling Uniden they did not have it, go figure.

The Charge rate on the battery terminals when using NiMh mode is ...

275 mAh when the unit is turned off. Fairly consistent.
265-270 mAh when unit is turned on and plugged in to power. This fluctuates whether there is active reception in progress or just scanning.
If the power is not plugged in the draw rate from batteries is 160-180 mAh. This fluctuates based on whether its scanning or receiving and outputting the audio. Squelch and Volume will play a role here.

I figured this out by putting a mutimeter in line.

So if you have 2700 mAh Battery at zero charge in the unit, you need to charge the batteries for ~10 Hours for a full charge.

If you have other capacities just do the math. Keep in mind you are not charging a battery from zero typically.
Here is a calculator ...
http://convert-to.com/491/recharging-rechargeable-nimh-nicd-batteries.html

The unit starts to complain the battery is low when 3.5 volts is registered.

Note that the unit does not have smart charging capability. It charges for as long as the Battery Charge setting is configured for. So the default 14 hour is way too long for just about any battery on the market today. Overcharging will kill the battery and over heat the unit/battery. Plus unplugging the power and putting it back in will start the cycle from the beginning.

I am testing a new pair of Sanyo LSD Eneloop 2500 mAh batteries using the Lacrosse 900 Charger. When the unit starts to beep at 3.5 volts I'll recharge the batteries in the LaCrosse and post the total mAh put back into the batteries. This will allow me (you) to set the charge rate accordingly, if you wanted to charge the batteries in the unit on occasion, when they register 3.5 volts remaining.

Charging is not 100% efficient. You typically need to allow for 20-30% of the charge current being dissipated as heat (even when not in overcharge state). If you charge 2700 mAH batteries for 10 hours at 270 mA, you'll end up with batteries that are only about 70% charged.

I just wanted to post this for everyone, since it was not listed anywhere, and after calling Uniden they did not have it, go figure.

The Charge rate on the battery terminals when using NiMh mode is ...

275 mAh when the unit is turned off. Fairly consistent.
265-270 mAh when unit is turned on and plugged in to power. This fluctuates whether there is active reception in progress or just scanning.
If the power is not plugged in the draw rate from batteries is 160-180 mAh. This fluctuates based on whether its scanning or receiving and outputting the audio. Squelch and Volume will play a role here.

I figured this out by putting a mutimeter in line.

So if you have 2700 mAh Battery at zero charge in the unit, you need to charge the batteries for ~10 Hours for a full charge.

If you have other capacities just do the math. Keep in mind you are not charging a battery from zero typically.
Here is a calculator ...
http://convert-to.com/491/recharging-rechargeable-nimh-nicd-batteries.html

The unit starts to complain the battery is low when 3.5 volts is registered.

Note that the unit does not have smart charging capability. It charges for as long as the Battery Charge setting is configured for. So the default 14 hour is way too long for just about any battery on the market today. Overcharging will kill the battery and over heat the unit/battery. Plus unplugging the power and putting it back in will start the cycle from the beginning.

I am testing a new pair of Sanyo LSD Eneloop 2500 mAh batteries using the Lacrosse 900 Charger. When the unit starts to beep at 3.5 volts I'll recharge the batteries in the LaCrosse and post the total mAh put back into the batteries. This will allow me (you) to set the charge rate accordingly, if you wanted to charge the batteries in the unit on occasion, when they register 3.5 volts remaining.

Thanks. Checked with the local vendor and they want $80/hr plus parts to fix it. Guess I'll be sending it to Texas and let Uniden have a go at it.

Rob

6271. Re: BCD396XT Battery Charge Rate Draw Rate UPDATE

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-08 21:54:09 UTC
From: Richard
Topic: 6265 Message: 6271

Here is the update ...

My LaCrosse Charger at 1000 mAh took 2.5 hours to charge and says that it needed to put back 2270 mAh back into each battery.

These were Sanyo LSD 2500 mAh batteries. So that means at 3.5 volts on the unit the batteries have only ~230 mAh left.

To put back 2270 mAh using the internal charge mechanism once the unit starts to beep would take 8.4 hours. Rounding to 9 hours for good measure and heat loss (minimal using LSD's) this is my new setting for the internal charges.

Your mileage may vary. Hope this helps someone else.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-08 22:04:24 UTC
From: John
Topic: 6261 Message: 6273

I learned the hard way with something else, and after investigating it a bit found there are many things that go into plastics and that glues affect those things differently.
The worst one I ever saw though was in 2007. A guy called saying he wanted to sell his stamp collection he inherited. He went through it and re-glued loose stamp holders in place. What he didn't realize was the stuff ate through the plastic and he wound up with the stamps permanently affixed to both the plastic and the pages. $1,000.00's in ruined stamps!

From: Richard
Topic: 6265 Message: 6275

These batteries are designed for that.
As a matter of fact they say they can charge at 1500 mAh max, which would mean a 90 minute recharge time to peak. They require a charger capable of that.
The LaCrosse 900 can do it.

6279. Anyone have a BCD396XT for sale?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-09 17:14:08 UTC
From: TNRamsFan
Topic: 6279 Message: 6279

Looking to buy one. Can pay via PayPal. Hav over 4500 + eBay transactions.

6280. I Calls with the Bcd396xt as well as status bits

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-11 12:50:40 UTC
From: Jerry Mader
Topic: 6221 Message: 6280

How does the bcd396xt handle status bits?
Also how can i get the ICall feature to work on my bcd396xt in an EDACS system. Is there some kind of talk group ID i need to program into it?
And how do I do that?
Thank you.
Jerry Mader

I have already set all the ICALLS for your radio.

Personally Ive never heard any icalls on consumers energy, I'm sure some have though.
Ive only heard them on Saginaw and some on the MPSCS. Be advised they are a rare thing.
How do you set them ? Manually - make a new talkgroup, then hit the . button twice and then the 0

In freescan add this is a talkgroup -> i0

Again I did that already for you.

Status bits - From my knowledge they are only for type II Motorola systems. MPSCS / Saginaw is not

Either in a search here or at radioreference.com im sure many answers to your questions already are available. You dont need to make an account on radioreference unless you post.

Also more freescan support here - http://forums.radioreference.com/scanner-programming-software/

Also more 396xt support here - http://forums.radioreference.com/uniden-scanners/

Go to Radioreferance.com, get a membership. then go to the freescan site and Download Freescan. Use Freescan to access the Radioreferance data base and download the information for your area. Load it into your scanner, When you upload the new information to your scanner be sure to click the box that says delete all other programs, and wa-La, your up and running.. Radio Referance is the source for all the information you will need and well worth the membership price.. Good luck

Ron, BCD396xt and BCD996xt

I just bought mine a couple weeks ago. I subscribed to RadioReference. I'm using the ARC XT Pro software. I download what I want from RadioReference.com right into the software. From there, just send it to the radio. What software are you using and are you a member of RadioReference?

I would second this; it's how I did it. I realized I didn't have to figure out systems and such because others had already done all of that. All I needed to do was take that info and get it into the scanner. FreeSCAN (http://www.sixspotsoftware.com) has come a long way with version 2 and is easier to use than ever. Get your RR premium membership, then in FreeSCAN choose File, Import, RadioReference Conventional or RadioReference Trunked. It can't be any easier. Once you've done that, then you can start to learn the nitty-gritty details of the hobby while already enjoying it. Makes it much easier and much less frustrating.

Even when seasoned scanner users get on of these for the first time they are scratching their heads.
They are very unconventional. You have to come around to their way of thinking.
Once mastered, they are a very powerful unit.

There is no longer channel numbers as a main reference. There are groups and systems.

The best thing to do is to download the easy to read translated manual in laymen's terms at http://marksscanners.com/396XT/396xt.shtml

Take your time and read this carefully and master one thing at a time. You will not master this scanner overnight !!!

Also download the free programming software (Freescan) below:
http://www.sixspotsoftware.com/

Read the notes for this carefully. This will save you a stack of time programming your scanner.
You can cut and paste out of an excel spreadsheet or word document.

I stepped up from an old UBC245XLT and found initially this one a pain in the rear.

Good luck and take it slowly. The reward of mastering it is worth it. The unit is a great scanner. It is extremely flexible.

I'm also a novice user.
I'm also totally blind so working with this radio is a little bit more harder for me as I can't see the screen of it.
But I'm getting used to certain Beep cues. SO I'm learning it a lot more better now.
My question is can the search keys be shut off so you can't hit them on accident or are they basically on by default?
Thanks
Jerry Mader

I'm an old hand with radio gear and scanners, and the 396 took me a while to get used to. As you say, once mastered, it's a brilliant scanner. It takes a change of mindset to get comfortable with.

A must read. This will get you familiar with the way the scanner is structured, so you can work with it.

>Take your time and read this carefully and master one thing at a
>time. You will not master this scanner overnight !!!

I'm barely scratching the surface! :)

>Also download the free programming software (Freescan) below:
>http://www.sixspotsoftware.com/
>
>Read the notes for this carefully. This will save you a stack of

>You can cut and paste out of an excel spreadsheet or word document.

Again, highly recommended. I use Freescan to manage my scanner, swear by it.

>I stepped up from an old UBC245XLT and found initially this one a
>pain in the rear.

I bought my 396 knowing that I will be needing P25 capability sometime in the future, as well as a scanner being a useful tool in the shack. Anyway, I now like the philosophy behind the BC396XT, especially as I use it primarily for monitoring CFA (the local fire service) frequencies. I have CFA and related frequencies as a system, a system for 27 MHz CB, one for UHF CB, and another system for amateur frequencies. CFA channels are labelled using their numbering system, so I can dial them up as if I was using one of

their radios, which is handy, same for CB channels.

>Good luck and take it slowly. The reward of mastering it is worth
>it. The unit is a great scanner. It is extremely flexible.

I second that. Take time to get to know the scanner, and you'll grow
to love it.

Yes Jerry the System SQ keys can be hit and turned on and off. Use the Key lock function to avoid this..(Hold the function key and turn on the scanner) number keys are now locked and non functional.. This is good when handing the scanner to someone who could possibly change your programming.

Good Luck.. Ron

An easy way to look at the Uniden Scanner is as a File Cabinet, the drawers are the systems, and the groups are the folder in the cabinet, and the channels are the pages in the folders.. Just like the structure in your computer. The rest is just a way to define the different sections of the cabinet..

Hope this helps. Ron

Uniden expects to release a firmware update for the BCD396XT and BCD996XT near the end of February. This update is intended to improve reception and decoding of APCO 25 systems on many systems.

We've been developing and testing
this update for a while, and are quite pleased overall with the improvements achieved.

Looking forward to getting this into your hands.

Could i ask this though I'm confused.
Can apco p25 use the Motorola status bits or no?
How will the scanner know if it's an emergency alert that is triggered?
Every time i try to enable that using Freescan it won't stick lol wondering
am I doing something wrong?

Uniden expects to release a firmware update for the BCD396XT and BCD996XT
near the end of February. This update is intended to improve reception and
decoding of APCO 25 systems on many systems.

We've been developing and testing
this update for a while, and are quite pleased overall with the improvements
achieved.

Looking forward to getting this into your hands.

More specifically, when doing a control channel search, and a control channel is discovered, the backlight comes on when it is
set to be triggered by squelch. I called this in awhile back to Uniden tech support, and did note it with you.

As firmware is coded currently, the backlight does not come on during a control channel search...

I sincerely hope this gets addressed...

Thank You Paul for your effort with these products...

you can change that setting in menu, setings, backlight. Otherwise you have to set it as an alert light for that channel.

No, you miss understand the nature of my post. Yes, the backlight comes on when Squelch is opened. But this issue,
is regarding Control Channel searches, where the radio decodes a control channel, but the backlight does not come on.

Try it for yourself. I have made Paul, and Uniden Tech Support aware of this...

Peace out,

-Lance

I believe that was answered as best it could be in Pauls original post

Qoute "
This update is intended to improve reception and decoding
of APCO 25 systems on many systems"

End quote....

6308. Analog vs Digital (P25) audio problems...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-16 15:34:59 UTC
From: lof674
Topic: 6308 Message: 6308

I am currently having issues with my radio when the P25 systems locally are on there is no problem hearing the audio. But when analog conventional systems are played the volume level seems to be cut in half if not more...

I live in cincy and the HamCo Trs is fine, along with marcs and the clermont system...but the conventional frequencies can barely be heard even with the scanner set at 15. I believe this to be a sound board issue, but have no idea how to correct it... I have left notes on the RR site for uniden, but have yet to hear from anyone at the company...

6309. Re: [BCD396XT] Analog vs Digital (P25) audio problems...

From: Uniden UPMan
Topic: 6308 Message: 6309

That is because I have no suggestions not already proferred. Your symptom sounds like the effect you would get if your conventional channels were programmed as FM instead of NFM.

If you tune to a local weather freq, is it also low?

I have to say, whenever UPMan gets a question like that and replies as he does, I always get a big grin on my face!! (Being quite sure Uniden is continually working on new scanners...and yes, I have little doubt there are MORE than one in the works at all times!)

Shell :)

6312. Firmware wish

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-23 00:39:42 UTC
From: ve5wil
Topic: 6312 Message: 6312

Hi Upman, and all

One wish I have for a firmware upgrade is to see a change in the memory architecture.

The issue I found , being in Saskatchewan Canada, we have I believe, one of the largest p25 trunk systems the Provincial Public Safety Telecommunications Network (over 240 towers and 2 portable ones, 770 radio channels, and thousands of rIDS and TG.)

I prefer to be able to alpha tag everything I find, rather then remember which rID is what. to date, I have 357 TG identified, and over 1650 radio ids, not counting encrypted.

(550 Agencies and 6000 users are now on this system)

any chances in the future, we may see a difference in the structure of memory?

Wil

I doubt that is going to happen, but the HomePatrol HP-1 will
display all the TG tags and RID tags, so there is a solution.

Does the Home Patrol have a limit on the number of RIDS that can be programed?

There is no limit on the GRE PSR-800.

It would be good if Uniden had more bandwidth and a faster server. It is
a frustrating site to use with all the timeouts and slow loading pages.

Thank you for announcement of the release.

Initial traffic surge should diminish, shortly. The server is barely OK under normal (1-5 hits/minute) conditions. Getting quite a few more hits than that, right now.

Initial traffic surge should diminish, shortly. The server is barely OK under normal (1-5 hits/minute) conditions. Getting quite a few more hits than that, right now.

6329. RE: [BCD396XT] Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-23 18:11:24 UTC
From: Robert Klamp Jr.
Topic: 6314 Message: 6329

I got through to the 996XT download there is a little improvement in P25 Decoding on starcom 21 I have three of them connected to a discone on the roof and still suffer from LSM drop outs even after the update but there is a small to medium margin of improvement in the decoding of P25 signals and picking up control channels I couldn't before. All in all improvement is improvement not as much as I would have liked to see but any improvement over how it was before is welcomed.

How much improvement are others seeing on P25 TRS systems?

Thanks,
Bob

6332. RE: [BCD396XT] Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-23 18:35:53 UTC
From: Robert Klamp Jr.
Topic: 6314 Message: 6332

Just applied the update to 396XT's and there is a major improvement in P25 Decoding especially on starcom 21 in northern Illinois. This update works very well I think my problem with the 996XT's may be too much antenna on the roof picking up the simulcast sites. Anyway to sum it up there is some improvement to my 996XT's and a major improvement on the 396XT's on the starcom 21 simulcast sites here in northern Illinois.

Again I would like to know what others think of the updated firmware?

Thanks Again,

Bob

What kind of server is it and how big a pipe is dedicated to it? I find the site under normal (non firmware release days ;-)) to be frustratingly slow in response when try to read and get information for the forums, wiki, etc. It would seem Uniden would want to have a responsive site and encourage ease of access to their product information.

Would it be possible to post the files to the yahoo group and off load some of the load on the Uniden server or are there licensing and distribution concerns that it must be on a Uniden hosted server?

Thank you again for sharing the release. I was lucky enough to download the files and complete the upgrade.

For a firmware update that is released once in a blue moon?

It is not like you need daily access to it.

I'd say it is something other than the site if it is always slow for you. I am on a netbook and the sites never slow on non-update days. There could be many reasons other than the site server causing it. It could be something with your ISP or your computer causing it. It loads quick for me on normal days and that’s saying something when using a cell service 24/7

Topic: 6314 Message: 6339

Best thing to do is wait 10 to 12 hours or a day after the release and let things calm down before attempting it Jerry.

it's not loading for me either.
Could the update be sent as an attachment or something or?
It's just not letting me connect at all.

Once someone has it or gets to download it, just upload it to the files
section that I did in the past
http://groups.yahoo.com/group/BCD396XT/files/Firmware/

Click on add file.

6344. Zip files.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-23 23:03:09 UTC
From: TrkNTrlrMan
Topic: 6344 Message: 6344

It would be nice if you would use self extracting files, not all of us have winzip, or want to buy it at a rediculas price...

6345. Re: [BCD396XT] Zip files.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-23 23:21:55 UTC
From: Paul Opitz
Topic: 6344 Message: 6345

Unfortunately, too many firewalls and virus scanners restrict or prevent downloading "exe' files. However, the last few versions of Windows has had native support for opening zip files (no 3rd party software needed).

Subject: RE: [BCD396XT] Firmware Update Released

Just applied the update to 396XT's and there is a major improvement in P25

Decoding especially on starcom 21 in northern Illinois. This update works

very well I think my problem with the 996XT's may be too much antenna on

the roof picking up the simulcast sites. Anyway to sum it up there is some

improvement to my 996XT's and a major improvement on the 396XT's on the

starcom 21 simulcast sites here in northern Illinois.

Again I would like to know what others think of the updated firmware?

Thanks Again,

Bob

ok Well this sucks.

Started the update it started erasing. Stopped and crashed. Now all I have is a blue and red blinking screen. Unplug / replug / batteries nothing fixes it. Also I cannot restart the update. Anyone have any Ideas how I screwed it up and how I can fix it

Vinnie

Once someone has it or gets to download it, just upload it to the files
section that I did in the past
http://groups.yahoo.com/group/BCD396XT/files/Firmware/

Click on add file.

6358. RE: [BCD396XT] Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-24 12:59:38 UTC
From: Robert Klamp Jr.
Topic: 6314 Message: 6358

After you have installed the new Firmware on your 396XT and/or 996XT successfully here are some instructions I found on the Radio Reference thread about how to get the best results once you have installed the update.

To adjust the decode threshold, start with the scanner powered off. Then, follow these steps:

While holding down the HOLD button, power on the scanner.

Access the hidden P25 Adjust Mode menu by MENU --> Settings --> P25 Adjust Mode.

Set the mode to 11, which is the optimal setting for most P25 systems.

If you have previously adjusted the P25 Adjust Level, reset it to a value of 50 by MENU --> Settings --> P25 Adjust Level.

Hope this helps,

Bob

6359. Firmware Update Success

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-24 12:59:29 UTC
From: Fred Halley
Topic: 6314 Message: 6359

I was able to download the Firmware update from the Uniden website with no problem at all and I was able to install the update following the instructions that came with the update.

I am already seeing a dramatic improvement in the quality of P25 signals.

FRED, W2EMS

Then get the FREE version of it!

Zip is a standard file that is used almost universally for compressed files. The only real competition is RAR but ZIP has the clear majority.

Date: 2012-02-24 13:13:06 UTC
From: Daniel Daigneault
Topic: 6344 Message: 6364

Greetings,

7zip is a free open source tool that will do all that Winzip does and
a little more. Available for windows. I have no affiliation with this
tool.

For the record I've been watching this list for some time now. Never
introduced myself.
I consider myself a casual scanner enthusiast however my wife says
that having 7 scanners is more than casual.
All but one is a Uniden scanner. Also a Amateur radio operator, can't
begin to count those...
s/Dan

6366. Re: [BCD396XT] Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-24 14:48:25 UTC
From: Paul Opitz
Topic: 6314 Message: 6366

If you are using a USB adapter, be sure you are using the very latest drivers for that adapter (drivers are specific to the adapter's chipset).

Then, restart the update. You cannot permanently brick the scanner by doing an update...you can always recover by starting over and completing the update.

Joe

The screen still blinks blue and red. It appears I have no control of the radio at all.

What happens if you try to put the scanner into firmware update mode? (6+L/O+power)

6367. Re: Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-24 16:29:09 UTC
From: chris tofer
Topic: 6314 Message: 6367

I just got a used bcd396xt a month ago.
I'm interested in firmware upgrade, because it has not been
decoding a harris P25 qpsk system 20 miles south, which has
two sides on the same freqs. They are 1.5hz off from each other and I get choppy voice
decoding probably because the two sites hetrodyne.
I downloaded the update, reinstalled the updater
and the updater says its a major change, you need a key.
I had a key for the bcd396t but that says it wont work.
Is this a free update or do you have to pay for it?
I did not see the firmware listed on the uniden site,
but downloaded it from the links here on yahoo groups.
Major change need software key and last time it came from "orders" at uniden.com ... need a way to get the key.
Don't use the prolific, they are no good at 115kb mine is error prone above 19200 buad. I use a desktop with a real RS232 on it and that works fine at 115kb/sec.
I have been using freescan to back up and edit.
I can't change system type except when I use freescan, so if you
need digital xt and you put in motorola, then the system won't decode.
If you put nothing but the control channel and digitial xt on the scanner then it will track and decode.
Maybe a bug.

We have two dual site systems in the area that simply duplicate the base station channels on a second site so they hetrodyne against each other. The techs do not set the time bases very close, Cedar Rapids sites are 1 hz off and Johnson county harris is 1.5hz off.
So you get data chop on both systems when signals are equal (15 miles out they are pretty close)

Thus the firmware update may be very beneficial.
By the wa Wi Co and Mn does not use these "dual site" on same channels system. Maybe its more a way to sell more base stations.. they could have easily split the channels between two sites but they only sell half the base station equipment. Maybe the moto/harris stuff copes with the hetrodyne effect better than unidens....
Thanks for a quick reply - Chris

I will have to agree David 100%. The Twiki organization is already frustrating enough but having to wait for pages to load makes it almost unusable.

It' a real turn-off to buy a product and not be able to navigate a support site for that product, especially if you have no choice but to go there for needed updates.

6370. Re: [BCD396XT] Re: Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-24 16:48:50 UTC
From: David Klippel
Topic: 6314 Message: 6370

You do not need a key as the instruction state in step 3, just click ok
and the upgrade should proceed.

http://info.uniden.com/UnidenMan4/BCD396XTFirmwareUpdate
also in the Yahoo groups files section under Firmware
==========
Installation Steps

Here is what you need to do to apply the 1.10.00 update.

1. Download the update by clicking BCD396XT_V1_10_00.zip and download
the latest version of BC_VUP (the firmware update tool) by clicking
BC_VUP_v2.0.0.7.zip.

2. Unzip both of the files you downloaded in Step 1 to your desktop.
Then run BC_VUP_v2.0.0.7.exe to install the firmware updater. (If you
previously installed a version of BC_VUP, be sure you delete the old
install files before reinstalling. These files are in a "BCSS" directory.)

3. Run the BC_VUP application you installed in Step 2. Follow all
on-screen instructions. You do not need to enter a registration key.
When prompted, select the BCD396XT_V1_10_00.scn file you unzipped in
Step 2.

6371. Re: [BCD396XT] Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-24 15:08:16 UTC
From: David Klippel
Topic: 6314 Message: 6371

Have you done the following steps to put the in mode for firmware upgrade? These step need to be repeated even if the backlight is already on to restart the update.

- turned the scanner off
- removed the batteries
- removed the power cord
- hold down L/O and 6 then plug power cord back in

http://info.uniden.com/UnidenMan4/BCD396XTFirmwareUpdate
==========
Update Troubleshooting

Follow these tips to troubleshoot any update problem you encounter: * When prompted, be sure to turn off the scanner, remove the batteries, and hold down both the L/O and 6 buttons while plugging in the AC adapter. The backlight should come on and remain on until the end of the update.

If an error occurs during the update, simply repeat all steps, including removing power, holding down L/O and 6, and plugging in AC power. Even if the backlight is already on, you need to repeat this step if you restart the update.
Almost all update error messages or faults that result in the scanner powering up with a blank display the the backlight on after the update are caused by:
Incorrect COM port selection: Be sure you have selected the COM port that the scanner is plugged into.
COM port software conflicts: No other software can be running that uses the COM port. Be sure to close any running scanner control software. Also, if you have ever used a PDA with this PC, there is probably synchronization software running all the time that takes over the COM port. You can usually stop that software by right-clicking on its icon in the lower right side of your PC screen, then selecting "Quit" or "Exit."

If your PC does not have a COM port, you can use a USB-->RS232 adapter. Uniden sells such an adapter specifically for this scanner (Model USB-1). Or, you can use many other adapters that are available at computer retailers. Note that some adapters do not work, or require updated drivers. Uniden only supports the USB-1.
Interruption during the update.
For all of the above conditions, you can restore normal scanner operation only by successfully applying the update. Restart the update from the beginning and ensure that you've followed all steps correctly.

How do i get a key for the major updates, i know what my serial number is
but I can't find the ESN of my product just the serial number on the back.
Would someone be able to help me know where to look for the other?

According to UPman, you don't need one...

Search for his previous posts from the last 24 hours...

I would paste, but it's deleted...

From: Jerry Mader
Topic: 6314 Message: 6374

Well I'm in the basement of my home for now and still experiencing dropouts
but not many.
I'm gonna head up stairs to see if that kind of cures the drop outs a bit.
And I'll report back.
I'm monitoring the P25 system for Saginaw county Michigan.
Jerry Mader

Subject: [BCD396XT] Firmware Update Success

I was able to download the Firmware update from the Uniden website with no
problem at all and I was able to install the update following the
instructions that came with the update.

I am already seeing a dramatic improvement in the quality of P25 signals.

FRED, W2EMS

At 800mhz, it doesn't surprise the radio is experiencing drop-outs...vegetation can affect signals at that frequency...

I know cause I was an RF field tech for awhile troubleshooting systems...

6378. Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-25 00:25:17 UTC
From: James F. Boehner MD
Topic: 6314 Message: 6378

Paul,

Thanks you and Uniden for providing the Firmware update for both the BCD396XT and BCD996XT scanners!

Just applied the update to three scanners, all smooth sailing!

'73 de JIM N2ZZ

6379. Re: [BCD396XT] Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)

From: Rob Jones
Topic: 6314 Message: 6379

I just upgraded my 396XT and 996XT as well and it was easy-peasy, lemon squeezy.

Thanks, UPman and Uniden.

Rob

The firmware is still at version 1. There hasn't
been a major update for the XT series yet.

6381. RE: [BCD396XT] Re: Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-25 02:28:42 UTC
From: Ron Aubry
Topic: 6314 Message: 6381

You don't need a Key Jerry, just click in ok and carry on per instructions..let it run untill finnished. you may need to have someone else let you know when it has finished then you can unplug it. I don't remember getting any tone when it was done(which would have been nice in your case). Good luck

"Ask not of your friends , That which your friends could not ask of you."

Subject: RE: [BCD396XT] Re: Firmware Update Released

How do i get a key for the major updates, i know what my serial number is

but I can't find the ESN of my product just the serial number on the back.

Would someone be able to help me know where to look for the other?

Jerry Mader

6382. Re: Firmware Update Released -- success but simulcast sites still problematic

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-25 03:54:17 UTC
From: chris tofer
Topic: 6314 Message: 6382

I archived the update files I had in the uniden folder for the bct396t then put the scanner in loader mode (6+lockout_no battery) and power up.....then it loaded OK.
Does this same firmware work in a bct396T as well?

It did improve reception on a cqpsk system 20 miles south.
The system is a 2 site simulcast with about a 2 hz frequency offset between the two sites. This is most evident when listening in analog AM wide, to the control channel. A 4.8khz tone modulated by the site to site freq difference (about 2-3 hz). That means a receiver AGC would have to track that extra AM modulation to keep the decoder in an optimal range. Not sure what the bandwidth of that tracking is but 2 hz is really hard for it to track. So the contol channel "wobulates" at 2 hz and the voices chop at about 2 hz from the data errors. I think I will contact the county down there and tell them they need to set the frequency between the two sites to zero beat each other - it would probably improve the performance for them too.

The Cedar Rapids system is C4fm not cqpsk so it doesnt suffer as much from the frequency error it has between its two site simulcast. Thats something Motorola and Harris dont tell you about on these simulcast systems, that if the frequency is too far apart on each site then they interfere with themselves. 20 miles out the two sites are the same level and hetrodyne as expected. They are not using a GPS time base which would put them within a tiny fraction of a hz from each other.

Cool doc on P25 simulcast sites:

6383. Re: [BCD396XT] Re: Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-24 18:47:50 UTC
From: chris451 hotmail
Topic: 6314 Message: 6383

I'll try again, I have a bct396t which uses the same folder, will zip everything there up and reinstall it. It asked for a key - major update it said.

----- Original Message -----

Sent: Friday, February 24, 2012 10:48 AM
Subject: Re: [BCD396XT] Re: Firmware Update Released

You do not need a key as the instruction state in step 3, just click ok
and the upgrade should proceed.

http://info.uniden.com/UnidenMan4/BCD396XTFirmwareUpdate
also in the Yahoo groups files section under Firmware
==========
Installation Steps

Here is what you need to do to apply the 1.10.00 update.

1. Download the update by clicking BCD396XT_V1_10_00.zip and download
the latest version of BC_VUP (the firmware update tool) by clicking
BC_VUP_v2.0.0.7.zip.

2. Unzip both of the files you downloaded in Step 1 to your desktop.
Then run BC_VUP_v2.0.0.7.exe to install the firmware updater. (If you
previously installed a version of BC_VUP, be sure you delete the old
install files before reinstalling. These files are in a "BCSS" directory.)

3. Run the BC_VUP application you installed in Step 2. Follow all
on-screen instructions. You do not need to enter a registration key.
When prompted, select the BCD396XT_V1_10_00.scn file you unzipped in
Step 2.

It doesn't need the key unless you check
the Major Update box. Don't check that box.

6386. RE: [BCD396XT] Firmware Update Released

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-02-25 07:32:27 UTC
From: Robert Klamp Jr.
Topic: 6314 Message: 6386

I know it's not basic procedure for updating the 396XT firmware but I got stuck at my office today and didn't have the power cable, I put 3 brand new doubles A's in the radio and held down L/O and 6 while I powered it on using the power button and the radio updated just fine so while the preferred and recommended way to update it is to insert the power cable while holding those keys my method seemed to work as well. Just wanted to let others know that there appears to be another option for the updating process if you do not have a power cable when you have to update the radio.

Hope this helps,

Bob

Subject: Re: [BCD396XT] Firmware Update Released

Have you done the following steps to put the in mode for firmware upgrade? These step need to be repeated even if the backlight is already on to restart the update.

- turned the scanner off
- removed the batteries
- removed the power cord
- hold down L/O and 6 then plug power cord back in

http://info.uniden.com/UnidenMan4/BCD396XTFirmwareUpdate
==========
Update Troubleshooting

Follow these tips to troubleshoot any update problem you encounter: * When prompted, be sure to turn off the scanner, remove the batteries, and hold down both the L/O and 6 buttons while plugging in the AC adapter. The backlight should come on and remain on until the end of the update.

If an error occurs during the update, simply repeat all steps, including removing power, holding down L/O and 6, and plugging in AC power. Even if the backlight is already on, you need to repeat this step if you restart the update.
Almost all update error messages or faults that result in the scanner powering up with a blank display the the backlight on after the update are caused by:
Incorrect COM port selection: Be sure you have selected the COM port that the scanner is plugged into.

COM port software conflicts: No other software can be running
that uses the COM port. Be sure to close any running scanner control
software. Also, if you have ever used a PDA with this PC, there is
probably synchronization software running all the time that takes over
the COM port. You can usually stop that software by right-clicking on
its icon in the lower right side of your PC screen, then selecting
"Quit" or "Exit."

If your PC does not have a COM port, you can use a USB-->RS232
adapter. Uniden sells such an adapter specifically for this scanner
(Model USB-1). Or, you can use many other adapters that are available at
computer retailers. Note that some adapters do not work, or require
updated drivers. Uniden only supports the USB-1.
Interruption during the update.
For all of the above conditions, you can restore normal scanner
operation only by successfully applying the update. Restart the update
from the beginning and ensure that you've followed all steps correctly.

I down-loaded and installed the 396XT software update on Friday. Used a KeySpan (Triplite) USB/Serial adapter to connect to the 396XT, which I also used with several amateur transceivers.

Decoding of the trunked Omaha, NE P25 system is defiantly better but the most impressive is consistent decoding of a non-trunked VHF P25 channel whose transmitter is located about 60 miles NE line-of-site. P25 is being decoded with when no signal strength is indicated (no bars) on the display. Antenna is a Diamond RH77CA w/SMA adapter mounted on the scanner.

Subject: Re: [BCD396XT] Firmware Update Released

Have you done the following steps to put the in mode for firmware

upgrade? These step need to be repeated even if the backlight is already

on to restart the update.

- turned the scanner off

- removed the batteries

- removed the power cord

- hold down L/O and 6 then plug power cord back in

http://info.uniden.com/UnidenMan4/BCD396XTFirmwareUpdate

==========

Update Troubleshooting

Follow these tips to troubleshoot any update problem you encounter: *

When prompted, be sure to turn off the scanner, remove the batteries,

and hold down both the L/O and 6 buttons while plugging in the AC

adapter. The backlight should come on and remain on until the end of the

update.

If an error occurs during the update, simply repeat all steps,

including removing power, holding down L/O and 6, and plugging in AC

power. Even if the backlight is already on, you need to repeat this step

if you restart the update.

Almost all update error messages or faults that result in the

scanner powering up with a blank display the the backlight on after the

update are caused by:

Incorrect COM port selection: Be sure you have selected the COM

port that the scanner is plugged into.

COM port software conflicts: No other software can be running

that uses the COM port. Be sure to close any running scanner control

software. Also, if you have ever used a PDA with this PC, there is

probably synchronization software running all the time that takes over

the COM port. You can usually stop that software by right-clicking on

its icon in the lower right side of your PC screen, then selecting

"Quit" or "Exit."

If your PC does not have a COM port, you can use a USB-->RS232

adapter. Uniden sells such an adapter specifically for this scanner

(Model USB-1). Or, you can use many other adapters that are available at computer retailers. Note that some adapters do not work, or require updated drivers. Uniden only supports the USB-1.

Interruption during the update.

For all of the above conditions, you can restore normal scanner operation only by successfully applying the update. Restart the update from the beginning and ensure that you've followed all steps correctly.

Just a note of caution using this method. You should only attempt this
using known good cells and cells that are well charged. If the cells go
low during the update, 'bad things' can happen.

Just a note of caution using this method. You should only attempt this

using known good cells and cells that are well charged. If the cells go

low during the update, 'bad things' can happen.

You'll need a program like free scan.
And you'll need a serial to USB adapter if you don't have a serial port on your laptop like most laptops don't.
You also could buy the USB cable over on the uniden site too.

You will next need to set the baud rate (115k) in the 396XT to match that of your software app to program the radio.

Also a com port must be selected.

Freescan works well as an app to program your radio. Others will chime in with suggestions of what they like...

The cable should have a CD included that has your drivers for Windows operating system.

You will need to install the drivers first. So, unplug the cable and pop the CD in. Do you have a CD that came
with the cable?

First you need to understand there is a difference between a Serial to USB Adapter and a Serial to USB Converter. The adapter is useless. If you have the Uniden USB-1 cable all you need to do is download the Serial to USB driver from the support site. Actually they have the driver for download at just about every place that sells the converter cable. You must install the driver BEFORE pluging in the cable. Also not all converters are equal I tried a couple before I broke down and bought the Uniden converter, it must use a specific chipset. I also ordered a converter from Monoprice for about 8 bucks just to see if it will work. I'll let you know how that one works out.

- 2276 USB to Serial Convert Cable(DB9M/USB B female converter and USB A/B cable) 1 $7.35 $7.35

Then you must discover what COM Port the driver has assigned to the converter. Go to the Device Manager in Windows and scroll down to Ports where you will see the USB Converter listed and it should show the Com Port it's using, if not look at the Properties and find it there. Once you know what Com Port is used you must select that in the scanner set up of whatever software you are using. The only thing left to do is match baud rates. Get to the menu in the scanner for setting the baud rate and select the 115,xxx baud rate and then select the same baud rate in the set up of the scanning software. Then they should be communicating.

That is the beauty of these scanners with the software is you can do whatever you can imagine. I would recommend you subscribe to Radioreference.com which will give you access to their direct download databases. In your software read the radio's current data, and save that to a profile or however your software saves a configuration so you can reload that if you ever want to. Then download the data you desire from radio reference into a new profile in the software and then upload it to the radio. It should ask if you want to delete the existing data in the radio, which is OK because you can always reload anything anytime. The great thing is you can create an endless number of different profiles, save them, and load them into the radio at will. I'm using ARC-XT which I am very happy with, but Freescan does most of the same things and it's free, just a steeper learning curve.

For the latest uncensored news subscribe to:
www.FreedomsPhoenix.com and http://www.realityzone.com/currentperiod.html

Subject: [BCD396XT] Re: help

First you need to understand there is a difference between a Serial to USB
Adapter and a Serial to USB Converter. The adapter is useless. If you have
the Uniden USB-1 cable all you need to do is download the Serial to USB
driver from the support site. Actually they have the driver for download at
just about every place that sells the converter cable. You must install the
driver BEFORE pluging in the cable. Also not all converters are equal I
tried a couple before I broke down and bought the Uniden converter, it must
use a specific chipset. I also ordered a converter from Monoprice for about
8 bucks just to see if it will work. I'll let you know how that one works
out.

- 2276 USB to Serial Convert Cable(DB9M/USB B female converter and USB A/B
cable) 1 $7.35 $7.35

Then you must discover what COM Port the driver has assigned to the
converter. Go to the Device Manager in Windows and scroll down to Ports
where you will see the USB Converter listed and it should show the Com Port
it's using, if not look at the Properties and find it there. Once you know
what Com Port is used you must select that in the scanner set up of whatever
software you are using. The only thing left to do is match baud rates. Get
to the menu in the scanner for setting the baud rate and select the 115,xxx

baud rate and then select the same baud rate in the set up of the scanning software. Then they should be communicating.

6422. Re: [BCD396XT] Re: help

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-03-09 16:04:55 UTC
From: Bill Lauchlan
Topic: 6408 Message: 6422

The use of "adapter" and "converter" really doesn't make it clear what's going on here.

The Key point to understand is that devices exist which are nothing more than a piece of cable (wires) with a connector on each end.

For example, Uniden provides a cable along with the BCD396XT which has a 15pin D-Type on one end and a Mini-USB type connector on the other end.
That is only wires and the two connectors. You can call them adapters, converters or any other name you want.

What's required for connecting Scanner to the USB port on a Computer is an ACTIVE device which makes protocol changes and Voltage Level/Impedance and whatever
else is required to match RS232C to USB. That is what the Uniden USB-1 is. It consists of a "regular" USB connector , a MINI-USB type connector, some cable and the ACTIVE device to do the
Protocol translation.

That is only wires and the two connectors. You can call them adapters, converters or any other name you want."

Actually the included cable has a 9-pin RS232 connector on one end and a mini 4-conductor (not USB standard) connector on the other end.

6424. Adapter vs Converter

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-03-09 16:13:56 UTC
From: david40_33711
Topic: 6424 Message: 6424

The terms are use interchangeably in error. An adapter is just a wire for wire interface (no electronics). The converter has a chip (internal electronics) that converts the signals transparently and requires a software driver.

Like others, I'm still trying to determine the difference between an
'adapter' and a 'converter'.

> For example, Uniden provides a cable along with the BCD396XT which has a 15pin D-Type on one end and a Mini-USB type connector on the other end.
> That is only wires and the two connectors. You can call them adapters, converters or any other name you want.

If there is no electronics involved, it's called a cable. They are
neither adapters nor converters.

Joe M.

No, an adapter has electronics in it, too. It adapts one format to another. I have several USB adapters. A wire with connectors is called a cable. My lamp does not have an adapter on it - it has a cable which plugs into the wall socket.

Actually, there is an IC (chip) inside the Prolific adapter to convert RS-232 to USB...

So this makes it an:

A: Adapter
B: Converter
C: Cable
D: Something the Cat can rip up

Lance - Let us all know when the upgrade is available.

Just to add: I think all terms in general are used incorrectly according to someone else...future famous quote. lol

My point was exactly this and meant for the light communication that followed nothing more.

Have a great weekend all.

My girl friend has an converter Joe. It's a female to male speech converter.
It allows me to understand what she is trying to tell me, in terms the male
brain can make sense of...

There's supposed to be an upgrade this year that includes a whine and demand
filter...

:)

I think David is trying to say:

You don't need a generic USB / serial adapter (or converter) if you have the Uniden USB-1 cable. If you have the Uniden RS232 9 pin to funky four pin cable *and* you computer has no serial ports - you also need a generic USB to serial adapter.

Either way, you need one of the Uniden made cables.

Yes. The original request for help was regarding a laptop that has no serial port, so we are talking about using the USB port as an alternate connection to the computer's Com Ports.

"For example, Uniden provides a cable along with the BCD396XT which has a 15pin D-Type on one end and a Mini-USB type connector on the other end.
That is only wires and the two connectors. You can call them adapters, converters or any other name you want."

Actually the included cable has a 9-pin RS232 connector on one end and a mini 4-conductor (not USB standard) connector on the other end.

Not to put too fine a point on the matter, but the USB-1
has the converter/adapter built in. It's not just a cable.

You still need drivers the same as if you had the adapter/converter.

Just wanted to reply. I have a BCD396XT and my computer laptop & desktop does not have a serial port on it. The programming cable for my radio uses a 9 pin serial end that would connect to the computers serial port. If you don't have this serial port you can purchase a usb to serial adapter. The one I use is the SW-1301. You can find it at www.sewell.com and type the model into the search box and you should see it. It works great for me and will work with Windows 7. If you need more information let us know so we can help you.

Good luck,
Joey

Not all USB to serial adaptors are the same. I have an HL-340 cable I bought off eBay a few years ago for win XP. It doesn't work on win 7, so I just bought a new HL-340 cable off eBay and it does work on win 7.

Are you saying it is the same thing? If so,
is it possible only the drivers are different?

If it's not the same, don't you love when they change things and
market it as the same product? Couldn't that have made it HL-341?

6442. Setup of the P25 Decode on the BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-03-11 18:32:37 UTC
From: Moose
Topic: 6442 Message: 6442

Now that we have the capability to "tune" the P25 audio decode via the last FW update, does anyone have any optimization procedures for the mode/level adjustments? There have been statements that for most P25 systems the optimal mode setting is 11...or maybe 8. what about 12, 10, 9, or 7? What's magic about level = 50? Also, the same question for the Digital AGC Response Time and Reference Gain settings. My experience with the BCD396XT on the local P25 ARMER system has been trying to get reliable P25 audio decode. The last FW update has helped.

Date: 2012-03-11 20:54:08 UTC
From: Lance
Topic: 6442 Message: 6443

I think to begin this discussion it's helpful to know the first setting, Mode, which points to a table in the radio firmware that allows for the width of decoding in terms of voltage levels plotted in low, med, high values. As you adjust this value, the plot points or window becomes wider, or more narrow. Larger number=wider window. Smaller number=narrower window.

The second setting, Level, is based on RSSI (Received Signal Strength Indicator). This setting tells the radio anything below this value do not attempt to decode. Trying decode when
the signal strength is very low (more noise and dropouts) is a feudal exercise for the radio...

I think the art in this is looking at your particular system of interest, and watching the errors rates your getting during a few minutes of radio traffic. Then decide if you need to adjust your decode window width (Mode). This implies you have a good signal level to work with. Uniden can not predict how many different systems we are going to listen to, nor the signal strength of each system. So, they suggest these default values as a means of drawing a balance for all the different conditions we might encounter while traveling. They came up with an average Mode and Level setting...

The interesting thing to note is yes we can set the width, and decode point, but if you watch the radio it remains in auto correct mode...this is different that the 396T model...

I have AGC Response times set to default. I don't want to induce the radio into a condition where it starts chasing it's own audio level wildly as a means to auto correct itself. There's a word for this condition, and It's not recalling for me in this moment...

I noticed immediately the firmware upgrade resulted in better (less) error rates.

Others and even Paul might add to this topic.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-03-12 00:28:41 UTC
From: Robert Klamp Jr.
Topic: 6442 Message: 6444

Here in Illinois found that the best setting for my starcom tower 101 DuPage was a setting of 9 while the 3600 baud system North West Central Dispatch is better received with a setting of 11. It seems different settings work better for different systems so you just have to adjust the settings and listen for any improvement or degradation in the p25 voice for the system you are trying to custom tune. I wish Uniden would have made it selectable by site because most of us have different systems in our radios and what works on system A may not work well on system B. Any way its all just trial and error until you find the optimal settings for your system.

Hope this helps,
Bob

When I first went digital I went with GRE, both PSR500 & 600, mainly due to the NAC decode capability. I had a 396t prior to that.

When the 396XT came out I bought one of those along with several 996XTs (Two for the car, one for logging at the house and one at work)

I was running a 996XT and PSR600 in the car at the same time so I had an opportunity to compare the two. What I realized pretty quick was that strong signals would overload the front end of the GRE's. I had to turn the attentuator on but this still caused degraded reception with weak signals.

I would recommend the XT's over GRE for that reason.

I'm in Sherman also.

One tip here, the link did not work. The reason is that the period is included in the link “BCD396XT.” does not exist, although “BCD396XT” does exist. Your email client just automatically included the period in the link. I usually start a new line after the link because I have found that even space may get included, which throws it off….

Subject: [BCD396XT] Need Input

I am trying to figure out what portable scanner I want to buy and have a few questions. What is the difference between the 396xt and 396t? I am in the Sherman area and all Law Enforcement is digital now, and trying to decide between Uniden and GRE. I have always been a Uniden person and have always been please but not sure on which one to get based on some of the reviews on the digital side. I really like and want to get the Remote head. Any input and or thoughts would be greatly appreciated. If you live in the area or monitor please give your input.

Thanks
Travis

>

Actually it was not Paul's E-Mail client - it was Yahoo on the web interface and / or your E-Mail client. The original message from Paul had the link correct on my E-Mail client (Thunderbird), as did your reply message. However the web interface to the group has it wrong on both the original and your reply. Thank you Yahoo...

However your point should be well taken. I normally put links on a line all by themselves for that very reason.

It will also help putting carrots around the link which should be
understood by all email clients. For example, <<LINK-ADDRRESS>>.

Note, the above is not sent as an actual link - replace
LINK-ADDRESS with the actual URL you are sending.

Thanks for the input Lance. Sounds like you have some background in digital radio.

Two qusetions from your response:

If the 396XT remains in the auto correct mode, does that ultimately obviate the manual decode settings?

Regarding the Digital AGC settings: by "default", do you mean 0 for Response Time and 0 for Reference Gain?

Regards,

John

Subject: Re: [BCD396XT] Setup of the P25 Decode on the BCD396XT

I think to begin this discussion it's helpful to know the first setting, Mode, which points to a table in the radio firmware that allows for the width of decoding in terms of voltage levels plotted in low, med, high values. As you adjust this value, the plot points or window becomes wider, or more narrow. Larger number=wider window. Smaller number=narrower window.

The second setting, Level, is based on RSSI (Received Signal Strength Indicator). This setting tells the radio anything below this value do not attempt to decode. Trying decode when
the signal strength is very low (more noise and dropouts) is a feudal exercise for the radio...

I think the art in this is looking at your particular system of interest, and watching the errors rates your getting during a few minutes of radio traffic. Then decide if you need to adjust your decode window width (Mode). This implies you have a good signal level to work with. Uniden can not predict how many different systems we are going to listen to, nor the signal strength of each system. So, they suggest these default values as a means of drawing a balance for all the different conditions we might encounter while traveling. They came up with an average Mode and Level setting...

The interesting thing to note is yes we can set the width, and decode point, but if you watch the radio it remains in auto correct mode...this is different that the 396T model...

I have AGC Response times set to default. I don't want to induce the radio into a condition where it starts chasing it's own audio level wildly as a means to auto correct itself. There's a word for this condition, and It's not recalling for me in this moment...

I noticed immediately the firmware upgrade resulted in better (less) error rates.

Others and even Paul might add to this topic.

Thanks for the reply Bob.
The ARMER system in the MSP metro area that I monitor employs a Common Air Interface (CAI) @ 9600 bps QPSK-c modulation.
With that said, I really don't notice a significant difference in the mode settings between 11 and 8. Both work and both experience audio
decode errors.
Maybe more information will become available as we experiment with the settings.

Regards,
John

Subject: RE: [BCD396XT] Setup of the P25 Decode on the BCD396XT

Here in Illinois found that the best setting for my starcom tower 101 DuPage was a setting of 9 while the 3600 baud system North West Central Dispatch is better received with a setting of 11. It seems different settings work better for different systems so you just have to adjust the settings and listen for any improvement or degradation in the p25 voice for the system you are trying to custom tune. I wish Uniden would have made it selectable by site because most of us have different systems in our radios and what works on system A may not work well on system B. Any way its all just trial and error until you find the optimal settings for your system.

Hope this helps,
Bob

Hello Everyone,
I'm not sure what I missed here. I have always been able to adjust the P25 Mode and P25 Level even before this latest update by using the procedure stated in the WiKi and I have tried most of the Mode settings and Level setting on a system near me and while sometimes I find a conbination that seems to work one day then the next day it's all garbbled again and hard to make out. So unless Uniden actualy changed something in the firmware that helps then maybe it will be better. I have just now updated my scanner from V1.08.14 to V1.10.00, so I will try this new firmware and the default settings and see how it does.
As I said before though, I have always been able to adjust the P25 Mode and P25 Level even in the older firmware.

The radio only comes with the serial port cable. If your computer does not have a serial port (and most new ones do not) then you need the serial to USB converter cable. I will agree, for what they charge for this radio it should come USB capable without having to buy anything else.

Hi Everyone,

I hope this e-mail finds you doing well. I'm having difficulty receiving Oakland's new digital P 25 system on my 396 XT. I have able to receive Oakland's P 25 system on my 396T loud and clear. Any suggestions? It appears that 396 XT is not tracking the system fully. Periodically what I did hear transmissions. They are not complete. Seems to not be tracking correctly. I've tried every different setting that I can think of to solve the problem. If someone has the open file available in Beutel or free scan and wouldn't mind sending it to me. It would be very much appreciated.

Thanks again for your help!

Best, Peter.

Try turning up your squelch to 2.
I had to do this even with the firmware installed for the Saginaw county simulcast.
Seems crazy but it's true.
Just turn it to just after you hear the static, that's function scroll knob.
But punch in a frequency of like 161.000 or some odd ball frequency like that and then turn the squelch so you can hear the static.

Later

If you delete a system on your laptop, and then upload it to the radio, yes what you deleted will be mirrored on your radio.

When I first got my radio, I downloaded it's factory programmed systems to my software (FreeSCAN), and then saved that copy as a original base line.

Then, I started deleting what I didn't need, and add my own systems and groups in software.

Next, I saved it, and then upload my finished work to the radio.

Keep in mind the systems that come with the radio are in the firmware. Even if you erase the memory, when you go to Reset the Radio (press Hold,2, 9, & On Button simultanously) the radio will ask if you want the original factory systems loaded. I usually choose NO because I want memory empty to receive the new profile I created. Another reason I reset the radio every time I load a profile is that I have had problems with memory becoming corrupted when I try to erase and load a new profile from the software. So no matter how bad you might screw things up just do a Reset, and if you want the factory setup and systems just select Yes when asked.

I've never had to do a full reset when I upload or save, that is very interesting...

Using FreeSCAN.

I'm using ARC-XT Pro, but I have heard from other users with Freescan and others who get occasional glitches. Like all of a sudden one system won't scan, or you might have only one system active but it still scans other systems. Just wierd squirly stuff that happens. They tell me it's the radio's memory messing up not the software, but who knows for sure. Some people just reload everything but I have found it's easier to just reset. I want to try using FreeScan but they are having a issues with it running under XP. They are working on trying to fix the problems.

I have freescan working on XP in a virtual environment, so its running within Apple OSX.

I've never had FreeSCAN give me problems. If your radio is scanning multiple systems, you might want to verify the systems you don't want active are indeed locked-out,
and or check to see if you have multiple quick keys assigned to one system...

That's what is driving the FreeScan programmer nuts. It works fine on some XP machines and others it won't. It will not run on mine or my daughter's computer. He sent me a couple of experimental versions to try that failed. He can't duplicate the problem on his computer and that makes it even harder to figure out.
I do all my setup in the software and never make any changes directly to the radio. It's not lock-outs because I don't use them. So I know it's not anything like that or shared Qkeys because all I have to do is reset the radio and reload, then everything is fine. I only run into problems if I try to reload a new profile without reseting the radio first, even when I check the box that says delete all existing systems. I guess some remnant remains that corrupts something. But no problem it only take two minutes to completely reload everything.

Never had a problem with FreeScan on any computer since it's inception. And most issues it has been user error and not the program causing issues.

Does Uniden have anything up their sleeve about replacing the 396xt/996xt anytime soon. I know both have been out for a little while but I dont want to spend a bunch of money on them to find out a newer version is coming out in a few months.

Thanks

6476. Re: Wondering

From: Gary Rogalski
Topic: 6475 Message: 6476

I just purchased both of them 2 weeks ago from ScannerMaster and love them both. I was kinda worried about that... but it really depends on the area that you are in and what the radio systems are that you will monitor. I always like the latest and greatest but about 1000.00 later with my accessories, I am very happy!

I have been away from the hobby for some time and even if they do relase something shortly I will add another to my "Stack"

Hope this helps

I would tend to doubt it. The thing operates on Dynamic Memory and the firmware can be redesigned and uploaded to the radio at will. I figure they will likely charge a fee for any major firmware ugrades that would esentially be like a new radio.
Personally I'd like to see them make the Groups operate the same way Systems operate so we can toggle more than 10 groups on and off per system.

There is also ample examples where leaked new-product news hurts
existing-product sales. Smart companies will be tight-lipped about futures.

Get a '396XT - you'll love it!

Keep in mind that Uniden just released a new scanner this year (the BC125AT), so if there is something in the works, it will likely be at least the end of summer before you see it. I'm not saying there will be a new model then - just that we likely won't see anything *before* then.

Also, they likely won't release both the mobile and the portable at the same time, so that should extend the life of the 996 for even longer.

If I had to guess, I would say the 396 will be replaced before the 996 only because the portables have been released first for many years.

Of course, Uniden could come up with something that will replace both at the same time and revolutionize the industry again - maybe a model that includes thought control. :-)

Another thought comes to mind: The economy. That slows down everything (including product releases), as companies aren't jumping on things the way they were before sales went in the crapper. Yes, the XT series is getting a little long in the tooth, but the size is acceptable by today's standards and the feature set isn't really outdated compared to what else they could add.

On the other hand, there is P25 Phase II which should light a fire under the bean counters. That is one item that the XTs don't support.

I fully agree... This would be a nice addition.... and I would like to have the colors for the alerts changed so it stays on throughout the entire transmission.

It already does that.use freescan, change the color where you enter the frequency. for more than 10 groups use the (period) "." before the no like .23 works great.

If that does work then great that gives me another 10 Groups I can toggle, but the radio itself is limited to 20 Groups per system. Because of that I had to setup three copies of the same System in the radio so I could add more custom groups.
So how does that work out on the display? I know for the Systems you can see S0, S1, S3, etc., to display toggled Systems in groups of 10. If I toggle Group ".23" how does that show up on the display?

Opps! Correction, I just realized ".23" is a bad example since there is a 20 Group limit per system. A better example would be ".18"

That will activate/deactivate any system above 0-9

So if you have a conventional system with more than 10 groups, how do you activate/deactivate them according to your understanding?

From: Lance
Topic: 6475 Message: 6486

You can store up to 20 'Groups' per 'System' with up to 1000 frequencies or 500 IDs in each 'Group'.

However, "There are 100 'System/Site/Search Quick Keys' (0-99) and 10 and 'Group Quick Keys' (0-9)".

So that says you can have 20 groups within a system, but only 10 of those can be "Group Quick Key" assigned...

The others you would have to lock/unlock in order to control what you want to scan out of the remaining groups...

The scanner only allows 10 Group Quick Keys (0-9) per system. You can, if you wish, assign more than one group in a system to the same quick key. Both groups will then be controlled by that Group Quick Key.

You can go in the menus and lockout a specific group , which will then not be scanned even if it's Quick Key is enabled.

Regarding the screen color: If you set an alert color, the screen will change to that color when a signal is detected on that channel, but it does not stay that color. It changes back to the default screen color after a few seconds even if the signal is still present. I am not aware of a way to change that behavior.

That's what I thought. Maybe he has System and Groups confused? I still can't understand why they would setup the firmware to allow storing 20 Groups but then give us only 10 Group Qkeys for them?
The other pet peeve I have is the way Number Tags work. You can assign anything to a Number Tag but will only manually step through multiple items, it won't Scan multiple items attached to that Tag automatically. If it DID do that we'd hardly need the Groups feature at all.
Gee that just gave me an idea to access the other 10 groups that are not assigned to one of the ten Qkeys. I wonder if I can assign Number Tags to eachof those other 10 Groups and scan them that way. Interesting experiment to try.....

I think the other Ron may still be confusing Systems and Groups and
their respective functions.

For Systems, you must be scanning, and you press the SQK number (or the
decimal point and a double-digit number) to enable/disable.

For Groups, you must be on the System you wish to change the Group
status on (either in HOLD or SCANNING mode), and you press FUNC then the
GQK which is always a single digit.

6499. RE: [BCD396XT] Re: Wondering

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-03-23 21:01:25 UTC
From: Michael Sigler
Topic: 6475 Message: 6499

I'll throw another wish item on there too. A Clock would be handy, I know it sounds crazy, but sometimes I only have my scanner and a clock would be helpful too.

Mike

Subject: Re: [BCD396XT] Re: Wondering

Another wish for updates etc., adding the delay feature to "each" channel in within the scanner. Not just to the system's as a whole. And while we are asking, how bout adding 3 and 4 seconds to the delay times. What the heck.

I think the other Ron may still be confusing Systems and Groups and
their respective functions.

For Systems, you must be scanning, and you press the SQK number (or the
decimal point and a double-digit number) to enable/disable.

For Groups, you must be on the System you wish to change the Group
status on (either in HOLD or SCANNING mode), and you press FUNC then the
GQK which is always a single digit.

here's one.
How about adding in a way for the scanner to pick up or receive E A S info from a broadcast radio station.
Why couldn't this be done? I mean, the scanner can already tune into the fm broadcast band so this should be easy, though I'm not a programmer so it probably isn't.
But i thought I'd throw it out there.

Topic: 6514 Message: 6514

Hi,

I would go to E-Bay, $ 400 is a little steep for this group. I just paid $403 for a Home Patrol on Sale.

My good buddy George stated this on the 396T group and I think it has a lot of merit.

Ray

George states:

Now this is just a thought on this, and it's for both the prospective buyer as well as the seller.

1. Remember that manufacturers don't always honor warranties to people who are not the original buyer of the item. So that means that almost brand new or brand new doesn't have the same value anymore.
2. If the price of an item is almost the same price as the item new, that is not a good buy.
Accessories you might as well knock off 50% and the main item about 1/3rd..

I see people selling 396XTs for $429, when the item new is $449 in most places and some places selling it for slightly less.

Like someone said already, its pretty comical that people purchase things on sites like Ebay for almost the same price of the item new... simply cause they got into a bidding war.

Radios are sensitive electronic devices which can have problems due to a variety of things from manufacturer errors to weather related issues from being in hot or cold cars.. where the outside may not indicate a problem on the inside.

I bought an "almost brand new" R20 scanner 2yrs ago, paid $350 which was about $100 less than a new one to find out that while most of the receive was ok, some was not.

After sending it to have it checked out to icom, it had a loose solder connection at the board to the antenna connection. It cost me $80 to have it repaired and took 2 weeks.

It wasn't a good deal at all, and honestly I believe the guy who sold it to me and said he didn't know it had a problem he simply thought that it wasn't a good receiver and bought a different scanner and sold this one to me. I held no grudges, but vowed to never buy a piece of electronic gear used again. It works fine and I use it a 4th scanner , I now have all 396XTs.. and 996Ts and XTs..

see my point.. If you are going to buy a radio, scanner etc.. It has to be a good buy, at a significant discount... otherwise buy new...

Just my opinion..

George

Lance, those are portable hard drive cases and I've got a few of them hanging around. I decided to see if my 396 would fit in it, and I've uploaded a 7 shots showing the results.

http://groups.yahoo.com/group/BCD396XT/photos/album/52312665/pic/list

Basically if you take off the belt clip stud and the antenna, it's a tight fit, but it does close.

Oh and don't pay that price on ebay if you are interested. You can get them for about 6 bucks on amazon with free shipping.

Looks darn near useless to me. It's a closed case so you can't operate the
radio at all, without opening the thing.
I like the hard leather case with the openings and sturdy quick release belt
clip.

I agree completely David!! Except mine never moves.it's mobile.

I use the 396XT strictly in my personal car with a remote head.and it never
leaves the car (gets stored, locked in the glove box if I have to be away
from the car). But it's useless in a case like that, even with my remote
head.you cannot access the keypad and I do not use the keypad on the remote
head - it's mounted on the dash, up close to the windshield and doesn't move
at all.nor can I easily reach it. If I want to pause the radio I can do so
without even looking - it sits just to my right, in a cup holder and I know
where each button and knob is on it.again, without looking. I've had the
radio since it was released.I enjoy it every bit as much as the HP-1 - they
each serve a purpose equally well, IMHO.

Help!

I dropped my 396XT yesterday resulting in breaking a chuck out of the lower front corner of the case and cracking it. What are my options to fix it besides the current piece of black electric tape on it? It is possible to order a new front half of the case and repair it myself or does it have to go back to Uniden? The post about the hard drive case to protect it is a good idea, but even better would be one of those iPhone type rubber bumper outer shells to snap on. Any ideas?

Other than this, love my 396!

Thanks,

George in Folsom, CA

Uniden parts can sell you the parts to fix it or you can send it in and let Uniden fix it. If you don't want to do the job I or someone else on the list would probably do it for a small charge.

Sorry to hear the bad news, but you can get a complete case for a decent price from Uniden. Visit this site:
info.uniden.com/twiki/bin/view/UnidenMan4/PartsRequest

Good Luck, and maybe order an extra one just in case (no pun intended)

Hi all,

I have to agree with some of the prices out there you might as well buy new. Anything over $275 for the 396XT is probably a little high.

As for the sale Robert, it was at Radio Shack and it was on for a month they extended it at least once. It appears, going to the site you missed the sale. They will probably have one again, just be prepared. The $403 price was a great deal with a $20 off coupon the total price was with shipping and tax.

Ray

6536. Re: [BCD396XT] Re: Oakland California Page 25

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-04-03 19:12:41 UTC
From: Peter T.
Topic: 6514 Message: 6536

Hi Everyone,

I really difficulty receiving Oakland's new digital radio system using my 396 XT. I have installed firmware upgrade. I'm receiving a strong signal. However, digital transmissions seem to be broken. The scanner stops on a talk group, only receives a portion of the actual digital radio traffic. I am able to receive Oakland's digital system with my 396T. I have programmed my 396 XT by utilizing both butel software and programming manually.

Any assistance would be greatly appreciated!

Kindest regards,

Peter

Boy did you get ripped off. Mine, two years ago, in Toronto, cost me just $599. New. Retail.

Rob

6537. Scanners for sale

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-04-07 05:10:30 UTC
From: Neil
Topic: 6537 Message: 6537

I have two Uniden scanners for sale. Both are in pristine shape, no dings or scratches. All original accessories are included, including CDs, PC interface cables, Power adapters, original box, - everything you get with a brand new scanner. Both function perfectly.

The first one is a BCD 396XT and I am asking for a minimum of US $330 and will accept the best offer received by April 15th.

The second one is a BCD 996XT, with all original accessories included. It is still in warranty, less than one year old. Asking for a minimum of US $350

I am the original owner of both scanners and I have an e-Bay rating of 100% positive. My eBay user name is "neilbell"

Shipping and insurance cost by USPS or UPS is $15 for each scanner. If you want both I will ship both for $20. I pack carefully in a double box and ship promptly.

Please reply by e-mail, not by posting on the group. I accept paypal or USPS money orders. Make me an offer the best offer by April 15th gets the scanner(s). Otherwise they go on to eBay.

Any questions or offers by e-mal please!!

Neil Bell, KJ6FBA

Good Morning

Does anyone know how to change on the display from the frequency to the name on the channel?

Thanks
John

You are going to get multiple answers since you didn't specify whether
you have the 396T model or the 396XT model - you only said 396. We can
assume that you meant XT because you are posting to the XT list, but you
are getting answers for both units.

Put the scanner in "HOLD", press and hold the Function key, press and release the "5" key.

Everyone posting "FUNC 5" should be aware that on the
396XT FUNC 5 sets the volume offset and not the display.

Also on the 396XT the function button is
'sticky', so there is no need to hold it.

Since he asked "from frequency to name" it's not unreasonable to think
that for some reason he's asking about the 396t on the XT list. Maybe
he's not a high end scanner user like we are and assumes that they are
the same thing.

I wasn't aware that the function key was sticky on the XT portable.
Thanks, that makes things easier.

See my other post. I mentioned that answers will
be forthcoming for both units due to the ambiguity.

The function key will timeout on the XT after
5 seconds or so, but generally it is 'sticky'.

Of course, on the 396T the function key is not sticky at all.

it's sticky if you hold it in long enough, then the F symbol blinks, indicating
FUNC mode is ON without timing out...

6549. Systems With Separate Base & Mobile Channels

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-04-09 03:41:00 UTC
From: Tony Olivero
Topic: 6549 Message: 6549

All:

Our local state police are still using some low band channels with base stations on one cfrequency and mobiles on another. An LTR system I occasionally monitor exhibits similar behavior. Is it possible to get the x96XT to hold on a system for a few seconds to see if a response is heard on another channel? I thought I saw a "system hold time" option in Freescan but wasn't sure if this would work (it hasn't seemed to). Is there a trick to setting both the delay (for the channels) and the hold time (for the systems)? I'm guessing what's happening is System Hold says "scan for x seconds and move to another system," but does it also hold for that many seconds after a monitored channel's carrier has dropped and delay has expired?

Any thoughts or advice would be appreciated.

Thanks,

Tony

If you hold the HOLD button, you will put the scanner into System
Hold mode. To exit this mode, just hold the HOLD button again.

That's not true. Holding the Func Button locks or unlocks the Funtion Mode by toggling it on or off.
Holding on a system can be done by toggling the rest of the systems off, or assigning a system to a quick key.

From: Milton Engle
Topic: 6549 Message: 6552

System Hold is a manually entered function. Press the HOLD button for 2 seconds and the scanner stops scanning all systems and stays on the selected system, scanning only what is programmed into that system. Be sure to do this while there is activity on a channel in the system.

If you want to scan just the state police LB two frequency simplex radio system, I would recommend a second analog only scanner programmed to receive just base and mobile frequencies with no delays.

Scanning a two frequency simplex (aka semi-duplex) system is rather hard to do in conjunction with scanning other frequencies. A mobile only hears the base frequency unless equipped to receive the mobile channel as well, and the base side only hears the mobiles.

A scanner would stop on the first signal received, wait for any delay to expire, and resume scanning. If the order of channels is: base freq, mobile freq, freq 3, freq 4, etc.; and the scanner hears a transmission on the mobile freq., it will have to scan through any and all other channels before returning to the base frequency (providing that none of the other channels are active), often resulting in missing some or all of the base transmission.

Putting it another way, the more channels you try to listen to, the less you will actually hear.

What Joe said was 100% correct. While what you say (after the first sentence) is also correct, it isn't what Joe said (and Joe's method is better).

You are correct. Don't know if that is an effect or deliberate as part of the design, but toggling the Function Mode On does have the effect of holding on whatever site, system, or search is active at that moment.

It is by design. Otherwise, it would be almost impossible to turn on/off channel groups in the intended system.

Re-read my post, as I think you misread it.
I never mentioned the FUNC button.

And holding on a system can be done as I described. Try it.

6558. 396XT Audio

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-04-10 01:29:51 UTC
From: tachorn@live.com
Topic: 6558 Message: 6558

I just ordered the 396XT and RH96, I am planning on putting the radio in my desk and using the remote head beside my bed, will I have any problems with the 396XT pushing the audio around 25-30ft? or using the RH96 with that much extension cable?

Thanks
T

No, you will be fine. Low impedance audio (8 ohms) will work great. Assuming its around 8 ohms, haven't
look at the specs.

There is a kit you can get to extend the RH-96 from the Uniden Radio.
It uses one of the twisted pairs inside CAT5 ethernet cable to carry the audio,
in addition to all data between the two devices.

look here http://www.rpc-electronics.com/rh96rmk.php

Search up on youtube, he has some videos on this.

Have fun,

-Lance

From: Raymond Hill
Topic: 6563 Message: 6563

Hi,

I wish you luck with the files for Macomb County. I don't have a 396XT so, I cant help you. It does surprise me that with all of these groups we are not overflowing with files. I uploaded files for Indiana and the all of New England States for the 396T in that group. There is not a lot of new stuff up there. I uploaded in the three formats ProScan, Scan Control & UASD, to cover all bases.

Have you thought about doing the research yourself and uploading the files for others. With Radio Reference it's a lot easier now than it used to be.

Ray

From: Rob Jones
Topic: 6563 Message: 6564

I don't know about others, but I have a premium account with RadioReference so I can download systems directly using FreeScan. I do that because I don't know enough about these scanners, the systems, the different modulations (FM, NFM, P25, etc.) to be able to program them from scratch by myself. I pay for that premium account, and I'm not about to give away for free to others that which I had to pay for.

I like to help out when I can with bits and pieces of info where appropriate, and I expect that others will assist me when I'm in need as well, but I don't expect them to hand over the whole farm when they've worked hard or spent money to have done it all themselves.

Rob

I, however, do not agree with Rob. I am saying that Rob is wrong with this line of thinking? Not at all. We just simply choose to look at this differently. Even though I have a paid subscription to Radio Reference, I do not mind sharing the what information I have. Much of what I have learned about scanners comes 50% from trying things out, and 50% help from others. I plan to pay that forward.

I have uploaded 2 Freescan files. One in the Mi area, and one in MN. I hope this helps others.

Michael....

I'm just the opposite of Mr. Jones no offense. But when I got into scanning people helped me and when I found these groups people helped even more by sharing there radio files if not to use then to see how they were utilized. That's what our groups are about sharing your hard work with our fellow scanner community. I am more than happy to list spare parts like cables and battery packs for free when I have extra (ask around I have) and send my scanner profile or v-folder to somebody who needed help. Heck I have written whole profiles or v-folders for people that just couldn't wrap there heads around the radio and software for free too. Not to mention the countless hours I have spent on the phone helping people trouble shoot problems with there radios all over the country. Bottom line is these groups are in place for us to share with and help one another. What good is all that hard work you have done with your radio if only you benefit from it. I my self am here to help anybody any way I can, and that's what I thought this group was created for.

Have a good day all,
Bob

6571. 396XT & RH96

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-04-17 21:05:29 UTC
From: tachorn@live.com
Topic: 6571 Message: 6571

I have only had the 2 for a week and boy do I have a lot to learn, these are way different than the 250D and 785D. I am trying to figure out if I am reading correclty on the alerts. If I have visual alerts set up for a convential channel will I see anything on the RH96? This is whats in the RH96 Manual "It emulates your mobile scanner's Close Call and Alert LED signals". I have the different screen alerts set up on the 396 and it works perfectly, I know the RH96 screen color wont change. So what alerts can be set up on the 396 that will show up on the RH96.

Thanks
Travis

Opps the question should have read.....

"Am I saying that Rob is wrong with this line of thinking?" Sorry about that Rob. Again, we are all here for different reasons, I respect those reasons.

--- In BCD396XT@yahoogroups.com, "MichaelH" <mrhowes@...> wrote:
>
> I, however, do not agree with Rob. I am saying that Rob is wrong with this line of thinking? Not at all. We just simply choose to look at this differently. Even though I have a paid subscription to Radio Reference, I do not mind sharing the what information I have. Much of what I have learned about scanners comes 50% from trying things out, and 50% help from others. I plan to pay that forward.

6582. Handheld Antenna

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-04-20 23:22:40 UTC
From: Mike
Topic: 6582 Message: 6582

I just got a BCD396XT and I did an archive search for the best antenna to use and it seems the talk was mostly about antennas for the home. It was about roof-top and discone antennas.

The stock antenna does not seem good at picking up conversations, even those close by. It starts late and ends after a second or two. Close Call and Weather are off. So I am guessing it is the antenna.

I am looking for an antenna to use on my handheld in my car, at home, while walking, and so on. I read in a wiki somewhere that a VHF 1/4 wave antenna is best. Is that true? What is a good brand?

Thanks.

Mike

Do you have certain frequencies in mind that you are looking for or just an antenna for general scanning.

I recommend both the RadioShack 800Mhz rubber duckie and the Antennex DEXE821. for general scanning with an 800 emphasis.

A quarter wave antenna for VHF is about 19"; I don't imagine you'd want to walk around with that.

First, if you are hearing the conversations, then the scanner just starts scanning again, that does not sounds like an antenna issue. Are you sure you haven't done something like enable a *negative* delay? A negative 2 second delay, for example, would do exactly what you said - remain on the channel for 2 seconds then move on - even if the conversation is still going on.

As for starting the conversation late, how many channels are you scanning? The more you scan, the more delay until the scanner hits an active channel.

There are better antennas than the stock antenna, but they are also larger for the most part. So, you have to answer how large is acceptable vs performance. But, I highly recommend you look into the first issue first, as your current antenna may be working fine. A quarter wave VHF antenna will be 18" tall. That may or may not be acceptable to you.

The stock antenna I find works well for what it is. Your symptoms sound like a combination of the normal operation of a scanner scanning a large number of frequencies and the settings used.

As for what antenna is best, it depends on what you want to use the scanner for. For me, the stock antenna is more than adequate for portable use. It is on a par with other rubber duck style antennas. For mobile use, I use a 160 MHz 1/2 wave. This is because this is my main band of interest, specifically, our fire service frequencies, which range from around 157 to 165 MHz. If I can receive other frequencies, that's a bonus, but I'm not counting on it. As it turns out, the antenna does seem to do a fair job at receiving the 2m amateur band (144-148 MHz) and UHF CB (477 MHz).

So it's a case of horses for courses. :)

6587. Re: [BCD396XT] Handheld Antenna

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-04-21 14:35:51 UTC
From: Robert Terzi
Topic: 6582 Message: 6587

As others have pointed out the original poster's question of receiving partial conversations likely has more to do with scanner settings and programming than antennas.

However since the question was asked about antennas, I thought I'd point out this how somewhat dated review from the Strong Signals web site:

http://www.strongsignals.net/access/reviews/reviews.cgi?type=display&rtype=rev&class=ant&num=003#083100

My primary interest lies in amateur radio plus some of the other VHF/UHF general stuff (public service, marine, gmrs, etc.)

I use a Diamond RH-77CA, 15" BNC whip on both my Uniden scanner and my ham handheld transceivers. I like to keep the BNC adapters on all my radios to avoid stress on the SMA connectors.

I also have a Radio Shack 20-006 telescoping metal whip. which was recommended in one of the uniden on-line forums that I've read. I haven't noticed the telescoping whip when fully extended picking up much that I didn't get with the Diamond RH-77CA.

Unfortunately both are a bit long for carrying around, so my next project is to find a 5" to 8" BNC flexible whip that is a good tradeoff for use when on my belt.

Please let me know when you do. I also will try to get more and will upload
the file. Your file was a GREAT starting spot. Thanks.

I want to do a little more reading about the scanner before I ask the
questions. I don't want to sound too dumb! LOL

Using FreeScan, I only see a Hold Tike of 0, P25 Wait Time of 0, Threshold of 9 (don't know what that is), and Delay Time of 2. Should I increase the Delay Time? I'm still reading the manual and learning about the scanner so ALL HELP is appreciated.

I am scanning about 50 channels.

No I do not want a tall antenna!

Thanks.

I monitor the 800 Mhz frequencies. I looked at the RS antenna and read the comments. Sounds like the one that I should get and only $20. Hard to lose on that kind of deal. Will get one ASAP.

Thanks.

I find they have similar performance. The Antenex gives it a 'cleaner' look
as it has an SMA connector which alleviates the need for the sma bnc adapter

If 800 MHz is your primary band of interest, I would add another endorsement of the Radio Shack 800 MHz antenna. It also does very well on UHF, and about as well at the stock antenna on VHF. On Low Band it stinks, but it will pick up strong signals there.

I have found so far that the Radio Shack 800MHz "rubber ducky" is one of the best handheld antennas for 800MHz. I live in an area that kinda sits lower than the surrounding area, and the RS 800MHz antenna has really helped bring in the signals where others have not performed quite as well. Heck for $20, you really can't go wrong.

Hi, so far I have found the Watson Wsma 889 to be my favourite antenna for
size and performance and it is reasonably priced as well. Another favourite
is the Diamond RH951S but that's not as convenient for size but
performs quite well.

An antenna tuned to 800 MHz would be a better choice for you. Same
principle as the 160 MHz antenna I use on the car. It's tuned to the
band of interest, so it should outperform a generic antenna.

6602. Not Staying On Channel/TG During Transmission

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-04-25 00:29:43 UTC
From: Mike
Topic: 6602 Message: 6602

I do not know if this is normal behavior or not as I am new to the BCD396XT.

When the scanner finds a channel/TG, the color light I set will go on and I will hear the transmission. However, looking at the scanner display, while I still I still hear the transmission, the light will go out and the scanner will start scanning channels/TGs again. I'll still hear the transmission from the TG, but the scanner will have moved on display-wise. Is that normal or do I have to adjust something?

Thanks in advance.

Mike

It's normal for the light to go out after about 5 seconds (or return to
the default color if you have the display light enabled).

But I've never heard of a case where a unit resumes scanning on the
display but still picks up the transmission. Are you are it's doing this
or are you assuming it is because the light went out?

Looking at my 396, when it hits an active transmission, the screen will light up to the color I have set, and the top line will switch between the name of the site (tower) it picked up the transmission from and the group name that contains the talkgroup/frequency that is transmitting. At the same time, the bottom 2 lines will each flash the hot key numbers corresponding to the site(tower) and group. If the transmission lasts long enough the the screen will either switch colors to the default, or go out (depending on how I have it set at the moment), and the transmission continues. So if this is what you see, than this is normal.

It would be sort of possible if the unit is receiving on a trunk system and
is set to display both the control channel and the voice channel, but it is
a back and forth toggle of the two frequencies.

Joe, I am looking at the display and see the scanner has resumed scanning the other channels. I just checked and the light was set to go out after 10 seconds. So that explains that issue. But I hear the transmission but see the scanner scanning the other channels. Sometimes it will jump back to the channel that was transmitting. Could a weak signal cause that? Just strong enough to hear but not strong enough to stop scanning?

Thanks.

Hmm. Interesting. Maybe that is what is happening. I will check it next time
and watch it VERY carefully. I'll have to figure out which is which though
(channel versus tower signals). Still new at this!!

That's exactly it. The display does
not change, but the backlight changes.

Pretty much 99% of the stock antenna that come with handheld scanners are the same. Simply a cheap (but effective) wide band antenna. So mixing them up and using them with different scanners will make little difference, and certainly will not harm your scanners any.

6616. Freq -> TGID

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-04-29 18:19:26 UTC
From: Mike
Topic: 6616 Message: 6616

I searched the archives but could not find an answer. Zero search results, maybe did not use correct wording.

I have the frequency for Mt Clemens, Michigan (866.40000) but do not have a TGID. If I have a frequency, how can I find the TGID so I can listen to the talkgroups?

Thanks in advance.

Mike

Are they on the statewide system? There should be more than one frequency if they are. Be prepared though, a lot of areas in Michigan on that system are encrypted so you won't hear a thing if they are.

Your question is confusing. If it is a truncked system, which it must be to have Talk Groups, and you have the frequency(ies), then all you need do is hit SCAN, and as the radio hits a Talk Group the ID will be displayed. Each Talk Group on the system will have it's own ID. If you can't find anyone who has logged and identified any TGID's in your area you will need to do it yourself. Once you find an ID, hold on it and listen till you figure out what it is, and repete the process creating your own list of ID's.

I could not find it. Part of the problem is that I do not fully understand how trunked versus conventional systems are entered. I'm still reading the manual and trying to learn. So it may be my fault that I cannot figure out the translation!

Hi Mike;

This may be the site you want to monitor.

http://www.radioreference.com/apps/db/?siteId=10224

This site is one of many on the state's massive system.

http://www.radioreference.com/apps/db/?sid=100

The folks here can help you program the radio.

Macomb County, Michigan. I am looking for Mt Clemens, the county seat. It is patrolled by the Sheriff's Office. I have the Sheriff's Office for the rest of the county but I know they are on a different frequency in Mt Clemens. The frequency I found on RadioReference.com is 866.40000.

Thank you. I love this scanner but it is long learning curve. Been reading the (easy to read) manual but it is a lot to digest quickly!

866.40000 is one of the frequencies on the Mt. Clemens site for the Michigan Public Safety Communications System. There are a total of 6 frequencies on that site. Also, there is another site in Macomb County that might carry the Sheriff's radio traffic (either or both could do so).

You need to program the system as a P25 system and include at least those two sites. The channels listed in RadioReference are under the heading "Macomb County (50) Law Enforcement Talkgroups" on this page: http://www.radioreference.com/apps/db/?sid=100

Thank you. There was a P25 site already in the system so I added some of the frequencies to it. I think I understand a little more now. Great radio, just a huge learning curve. Actually, the technology is the learning curve, not the radio.

Again, thanks.

6626. Re: [BCD396XT] Freq -> TGID

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-04-30 18:10:46 UTC
From: Michael R. Howes
Topic: 6616 Message: 6626

Hey Mike.

Let me see if I can explain this without confusing you further. In the old days, each agency would be assigned a set frequencies for their various operations. For instance, Roseville, MI might have 165.100 for the Police dispatch channel , 165.200 for Police car-to-car channel, 165.300 for Events channel, and 165.400 for special emergencies channel (Please Note that channel and frequencies represent different terms). So lets say that every police agency is set up in a similar way; each having a separate frequency for each of its various operations. One problem with this is that the frequencies assigned to Events and Special Emergencies may be rarely used. It is not the most efficient use of radio frequencies. What trunking does it allows an agency or agencies to share a smaller set of frequencies. In a trunked system, a central computer assigns these frequencies in real time, based on availability, as each agency goes to broadcast. Let take the example of Roseville, MI. Lets give them the set of frequencies listed above that were used just by the police department (165.100, 165.200, 165.300, and 165.400). Now in a trucked system we will share these frequencies with the entire city (Police, fire, maintenance, and parks a rec). When a radio within any one of these agencies goes to broadcast over a certain channel, the central system looks to see what frequencies are available, and assigns it temporarily to that channel . For example, Police Squad 1234 keys up his microphone to broadcast over PD dispatch, and the central system assigns PD dispatch 165.100. All radios that are monitoring the Police Dispatch channel are told that Police Dispatch channel is, at this moment, operating on 165.100. At the same time, Engine 51 keys up it's microphone to broadcast over Fire Scene1, and the central system assigns Fire Scene1 165.200. Again all radios set to monitor Fire Scene1 are told that Fire Scene1 channel is, at this moment, operating on 165.200 A minute later, Police dispatch channel no longer has traffic, but Fire Scene1 still does. Maintenance truck 5 goes to broadcast over the Citywide channel. The central system sees that now 165.100 165.300 and 165.400 are available, but 165.200 is not. The system then assigns the Citywide Channel the frequency 165.100. All radios that are monitoring the Citywide channel are told that Citywide channel is, at this moment, operating on 165.100. Later Squad 1234 again goes to broadcast on Police Dispatch, but now only 165.400 is available, (all others are being used by other channels). The system assigns 165.400 to Police Dispatch channel, not the frequency it had used earlier (165.100). This happens over and over again, many times a minute. In the most simple way this is how trucking works.

Now the APCO25 digital trunking system being used in various counties in Michigan (as well as other counties across the U.S.) works in this same way, but on a MUCH larger scale, with each tower site (or grouping) acting as a single trunk system. Each of these county trunk systems acts part larger statewide digital trunk system. But for now lets concentrate on macomb County. For Macomb County, there appears to be 2 trunk systems, Macomb Simulcast (Comprised of 9 towers), and Mt Clemens (Comprised of 1 single tower). Each of these systems (sometimes also called "sites") has a main and back-up control channel. These the frequencies are used to provide data information about the system, and helps to assign frequencies as they are needed. 866.400 is the main control frequency for the Mt Clemens

site. 868.900 is the back up control frequency for that site. The rest of the frequencies listed are the ones used for actual broadcasts, and are assigned by the main system via the control frequencies. Again this is a VERY simplistic representation Trunking, APCO-25 Digital Trunking, and the county of Macomb. There is much more to it, but lets just stop here for now.

I have taken the Macomb County file that I had created and posted on the Yahoo Group site, and have updated it with the Mt Clemens site, as well as Mt Clemens Fire FD info. The file should already have the needed information for County Sheriff. Hopefully the addition of the new tower site information will allow you to hear PD traffic for officers operating within the City of Mt Clemens. I hope this helps you, as well as others.

Mike, if you want, we can talk more about this via Skype and/or phone. You can email me directly at mrhowes@....

To everyone else, If I have made an error here, please let me know. I have tried to explain this is terms easy to understand, but I don't wish to make things worse by doing it in a way as to be confusing.

Thanks to everyone out there, and happy scanning.

Subject: Re: [BCD396XT] Freq -> TGID

Macomb County, Michigan. I am looking for Mt Clemens, the county seat. It is patrolled by the Sheriff's Office. I have the Sheriff's Office for the rest of the county but I know they are on a different frequency in Mt Clemens. The frequency I found on RadioReference.com is 866.40000.

Thank you. I love this scanner but it is long learning curve. Been reading the (easy to read) manual but it is a lot to digest quickly!

Mike

6627. Replacement Volume Knob

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-05-07 18:36:17 UTC
From: T
Topic: 6627 Message: 6627

I've lost the volume knob on my BCD396XT and need a replacement.

Radio Shack has knobs, but I'm not certain of the size to get if I need to order one thru the web vs going to the store.

Any clue what size knob I would need, or where else to get one?

6629. Creating groups in conventional systems (not Talk groups)

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-05-07 19:12:56 UTC
From: Terrell
Topic: 6629 Message: 6629

I have been researching about the "groups" (GRP) for my 396XT but have not found any real information about them. Groups (GRP) is the bottom line of the display and I can't find much info on creating, editing, deleting, etc. I have inadvertantly turned off a group and had to do a lot of reading to figure out why my quick key shows the system being active but tnere is nothing scanned. I found that I had to go into Function hold, scroll to the system, and then hit the group number that was created for it somehow. I never created any groups but they are in some of my systems just the same. Is there anyone who actually knows how "groups" work in conventional systems, and how to change or get rig of them?
I've heard that groups (GRP) are for organizing "police", "fire", "emergency", etc. in a conventional system that has a bunch of frequencies in it so you can scan only the sub-group you want to listen to.
I use ScanCat-Lite Plus for connecting to my computer.
If this is comfusing, think of how I feel.
Thanks for any help!

I am having some kind of interference with my p25. Pretty sure it's some cell phone towers and two others that are near by. Is there anything I can do about this? I moved the scanner around the house and it doesn't seem to help. Would a directional type antenna work?
Thanks,
Paul

Try turning on the attenuator. Are you sure your radio is getting desensitized by a nearby tower?

What does it sound like?

I am in the market for a new base antenna, I have the 369xt and want to get an antenna outside. I listen to VHF HI, UHF and some 800. Most of the 800 is 30-40 miles away. I am not wanting to break the bank, just want improved reception. Please give me some suggestions, I am really looking for an all band antenna.

Thanks
T

A discone antenna would probably be best but get good coax not rg58 or 59. 40 miles for 800mhz maybe issue but I only go for local 800 so take my 800 answer with grain of salt

If cost is a factor, you might wish to consider the ST-2 Scantenna.
I've had several of these over the years and I would say that,
performance-wise, they're hard to beat for the price. The first
generation ones were a bit flimsy but the newer ones are built more like
a typical TV antenna. They are pretty popular and can be purchased from
numerous sources... use Google - the following link is just an example:

A lot of it will depend on the height of your base antenna and your local average terrain height and where the transmitter and height of the transmitter is. The Discone antenna receives very well and its wideband. I have one myself and a preamp is always nice to use too.

That's what I was going to recommend. I have one right below a Discone, and it really kicks the Discone's rear end - picking up 5 weather channels when the Discone has trouble picking up three, for example.

You should be able to get the ST-2 for less than $50 shipped.

I don't like the Scantenna at all, had one destroyed by 40MPH wind while my discone survived a tornado that took out 40 trees in my yard. This discone isn't the cheap radio shack version but around $149 and with LMR400 coax and the antenna at around 65' I pick up Louisville Suburban VHF High band from 70+ miles away. Some days I hear Lexington PD and on occasion St Louis Fire 3 states away. The discone has always outperformed the scantenna for me, but then you get what you pay for too. Why skimp on an antenna and coax when your using a $500 scanner?

Try this:

http://marksscanners.com/396XT/396xt.shtml#create group

--- In BCD396XT@yahoogroups.com, "Terrell" <tthompson50@...> wrote:
>
> I have been researching about the "groups" (GRP) for my 396XT but have not found any real information about them. Groups (GRP) is the bottom line of the display and I can't find much info on creating, editing, deleting, etc. I have inadvertantly turned off a group and had to do a lot of reading to figure out why my quick key shows the system being active but tnere is nothing scanned. I found that I had to go into Function hold, scroll to the system, and then hit the group number that was created for it somehow. I never created any groups but they are in some of my systems just the same. Is there anyone who actually knows how "groups" work in conventional systems, and how to change or get rig of them?
> I've heard that groups (GRP) are for organizing "police", "fire", "emergency", etc. in a conventional system that has a bunch of frequencies in it so you can scan only the sub-group you want to listen to.
> I use ScanCat-Lite Plus for connecting to my computer.
> If this is comfusing, think of how I feel.

From: Michael Hopkins
Topic: 6635 Message: 6644

I use a Discone --- great omni directional antenna --- sitting on a 30 foot pole, but the trick is to use a good, low loss feed line. I use ½ inch semi-rigid hard line left over from the cable tv guys ☐ it☐s 75 ohms, but that doesn☐t matter much . Also, I have a commercially available pre-amp that☐s good to about 1GHz.

With the above, I can hear pretty much anything in a 60 mile radius .

Subject: [BCD396XT] Base Antenna Suggestion

I am in the market for a new base antenna, I have the 369xt and want to get an antenna outside. I listen to VHF HI, UHF and some 800. Most of the 800 is 30-40 miles away. I am not wanting to break the bank, just want improved reception. Please give me some suggestions, I am really looking for an all band antenna.

Thanks
T

That is actually a good solution. I used to be an RF Mobile Field Tech, and serviced a lot of systems. I visited a few sites that used NMO with ground plane
kit.

I saw the spectra yesterday while I was looking and it really caught my attention. What are my options for ground plane kits other than the one listed with the spectra? Do they make a ground plane kit with an N connector or pl259 so I can use a better feed line? I will need around 50ft feed line. I dont want a 7ft tall antenna on the house.

From: MICHAEL BENNETT
Topic: 6635 Message: 6653

The best multi-band antenna I've used is the LARSEN 150/450/800 mobile. I have one on my car, bicycle, and use a ground plane kit, similar to the one below, for a base. I'm using the 150 ground plane kit with the longer ground elements though.

I've never tried the "Spectra" but I do have the base version, the "Ferret" and I'm not too impressed with it's performance. It works pretty good on 150 mhz but that's about it.

From: MCH
Topic: 6635 Message: 6655

I love the Larsen NMO-2/70 dual band antennas. They work better than
anything else I've tried. I haven't tried the tri-band antennas, but
they are likely of similar design. Still, the dual band antennas work
very well on 800 MHz, and even decent on Low Band.

Joe M.

You can put an antenna on anything..... even my skid steer will have one with a mount for an HP1 and amplified speaker so I can listen while I tear up the yard.

6659. APCO Band Plan

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-05-15 03:35:24 UTC
From: ceidrafter
Topic: 6659 Message: 6659

I live in Johnson County Iowa. Should I have anything my APCO Band plan in my FreeScan file? Or does anybody have a FreeScan file for Johnson County that I could compare to the one I have? Any help would be great!!
Thanks,
Paul

6661. Re: APCO Band Plan << problem detected with simulcast cqpsk systems>>

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-05-16 00:41:02 UTC
From: chris tofer
Topic: 6659 Message: 6661

I live in Linn county, one county to the north of Johnson county.
I have been investigating the new Harris 6 site communications system.

Since I travel to many states on vacation and always take my P25 radio I have lots of systems I can compare this system to.

Some of the states: MN WI IL NC CO CA NE MT WY UT TX
In these states I found CQPSK, C4FM, Edacs, analog motorola, MotoTRBO, and some VHF UHF trunking.

About the Johnson County system, Jocomm...
It is a cqpsk system, as opposed to a C4FM system like Cedar Rapids.
Cqpsk uses a small amount of amplitude to clean the spectrum and phase modulation.

I've discovered that there is a serious problem with the system design. It has 6 linked sites using "simulcast" meaning they are all supposed to have the same waveform on each tower, so they can fill in areas and improve coverage. The idea was initially sold by Motorola, Harris has attempted to duplicate this feature, notably in Portland, St Louis, and Johnson county. It sounds like they've sold the same system to Linn county but nothing's happened yet. The motorola c4fm p25 system in CR has two sites "simulcast" but they aren't on exactly the same frequency just the modulation is duplicated. It works well most places but analog users have "flutter" and digital users have some "echo and chop" but the JOCO system seems much worse, going between unusable and poor to good if you use a beam to isolate down to one tower.

So the effect is the system interferes with itself. Its great under a tower but gets worse as the signal drops.

In answer to your question, the only way you can decode reliably is use a beam and point at the nearest tower (assuming you don't have a second tower behind it from your location. There is a ton of signal but its got a mix from second and third towers most of the time and that makes it chop and echo or not decode at all.

Some talk channels using lower power do better than higher power channels.

On the 2-3 sites I "see" from 20 miles north, the sites are within 2 hz of each other. When this first came online, it decoded so poorly I thought the system was motoTRBO or something, however I've learned to recognize that now.

What I've found when driving around is that the audio is broken up or not receivable in areas where two or more separate towers are equal signal level. I found I can "zero in " on one tower with a beam, and I get pretty good reception. I've found that when the beam is between sites that there's plenty of signal but its broken up at the beat rate between the two strongest radio towers.

So it appears they have synchronized the modulation, but not the carrier frequency. I'm not convinced they have the timing at zero difference. An "echo effect" can be observed, as the p25 tries to decode one tower's signal then the other. I assume that's because the decoder measures the phase of the strongest signal, but when two towers beat against each other, one is stronger then the other one is stronger, so the phase will shift between the two towers. In this case you will get poor or no decoding depending on how many towers illuminate your location with equal RF carrier levels. The best place to pick the system up would be right under one of their towers.

I have emailed Harris, (told them the eye pattern is ballooning in and out, why aren't they using gps to synchronize the carrier freqs. Johnson County Sherriff didnt respond til the supervisor wrote back. No answer yet from Harris.

the problem is not your BCD296xt, I'm not sure anything can decode a system like this. Including Harris equipment, (that is unless you are near a tower).

I plan on warning Linn County's comm director of this issue.

ok, what STATE.... I can think of 10 states off the top of my head with a Johnson County.....

Anyway the short of it, when systems are set up they are SUPPOSED to be set up to certain specs, doesn't mean they will be though and, in many cases they won't be. Doesn't mean the subscriber radios won't work, they should be programmed to the same specs and should work. Just because you can't scan the system the way you think you should doesn't mean a thing to Harris, Motorola or the local system users. Been there done that with Indy's P25 system. That system is way out of spec, but it continues on. With changes to Uniden scanners though you can now listen to them, but that also depends on where you are too. I hear it better 4 miles outside the city limits than many do inside city limits.....including some police and fire personnel.

6664. Stupid Grounding Question

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-05-16 01:10:43 UTC
From: tachorn@live.com
Topic: 6664 Message: 6664

I have been reading up on grounding antennas and am now a little confused on how or if I even need to do it. My main question is do you need to ground a base antenna if you unplug the radios in bad weather? I always unplug my radios from outside antenna sources in bad weather, I dont want to take a chance on loosing them with the money I have invested. Can someone please shed a little light on the subject?

Grounding is one of those subjects where there is no clear answer. Some people feel that isolating the antenna makes it less 'attractive' to lightning, and there is some logic to that theory.

Myself, I believe in a proper ground with surge suppressors on a well grounded bulkhead. This is the scheme most commercial tower sites use.

The problem with disconnecting the antenna is the sudden storm that comes up and you've not had a chance to disconnect the antenna, or you've forgotten.

I also believe that even without the scanner connected, you are allowing the lightning to find its own path. It can jump several feet from the end of the feedline, and you never know where it might jump to. It might jump to the scanner if it's close enough. If not, it might jump to an electrical outlet, a register vent, or any other path to ground it can find. When you don't give it a solid path to ground, it will find one, and it might not be a path you would prefer.

I could post a novel on lightning tactics and theory. (but I won't)

T,

It doesn't hurt to ground your antenna, it will reduce noise, and bleed off accumulated electrical charge. Lightning is a different story as opposed to small static accumulation say from a dry wind with low humidity.
I use thick wire and a copper rod pounded into soft dirt. Like MCH said, many theories, but if you have a good ground, and you take a hit, hopefully the lightning will follow the path of least resistance. I still disconnect the radios and move the coax into a corner away from other things. Small measures to protect our investment...

I have for sale a like new in the box bcd396xt. I have the box for the unit also. It also comes with sanyo envelop batteries and a diamond rh77ca antenna, along with the ac adapter and the serial cable. I have a serial to usb adapter also which is 10.00 extra.

I will ship it priority mail in the USA. No Canada, sorry.
I accept paypal.

375.00

Im located in the DFW area of Texas.

Thanks

Yep it's iowa! Would getting a directional antenna be the best bet? I think it might be battling towers cause I have one for miles south and about five miles west. But when I'm in the southern part of the county I don't get much chatter on it. Also I can't hear cedar rapids pd where I am.

A directional antenna should help.

Something else you can try is a lower gain antenna if that is the only system you are interested in. I've mentioned this to several people and it seems to solve simulcast issues for many of them. I use this method on one of my scanners, and it works great. The trick is to use the low gain antenna and put it in a null for all but one of the towers. This may take some trial and error, but it does work.

I believe you're doing the right thing for lightning protection: disconnect the antenna and unplug the radio..

If lightning is going to strike in a given area and your antenna is in the way, it isn't likely having it grounded or not will affect the result. There are other advantages to grounded antennas --- noise and static reduction mainly..

If the antenna is the highest structure in the area, it's likely to get hit if it's in the area of a charge build-up, grounded or not; if it's very high (more than 100 feet or so) there is some evidence it could induce a strike, but that part isn't really clear.

An even higher probability of losing a radio to lightning is via the ac mains. A lightning strike in the immediate area is likely to cause high currents in the surrounding ground, which in turn develop big voltage differences between ground and the ac mains - contrary to what one might think, GROUND is elevated to several thousand volts with respect to the ac mains (and everything else) causing flash-overs and high voltage transients on the mains --- up to about 6kV inside a structure. The clearest example of this are the large commercial towers that get hit all the time and the biggest problem is lightning taking out power supplies, blowing out light fixtures and breakers, not the transmitters or receivers..

Fun stuff..

6671. Serious issues found with the Harris "simulcast" P25 Cqpsk system

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-05-17 14:41:45 UTC
From: chris tofer
Topic: 6671 Message: 6671

I've been a Uniden digital scanner user since these first came out, have used each of the series of radios. 296, 396, 396 xt.
I've also traveled on some vacations and gathered some interesting data to support my points.

To start with, several states use Cqpsk and most new sytems are using this instead of c4fm.

A local agency Cedar Rapids City of, (Iowa) has had a motorola p25 system, using a mix of analog and digital, and all motorola, and using a two site "simulcast".

A nearby agency Johnson County Iowa and cities therein have installed in the last year a 6 site Cqpsk system (by Harris).

During my travels I've gathered some data on some Colorado Cqpsk multisite simulcast systems.

While on a train heading to denver I was able to pick up the Colorado springs system at 115 miles away, log that lat/long into the 396xt for later license analysis, so I have a freq and a location I can look up and verify the distance.

I mapped out where the 6 sites are on the Johnson county system.
I know where the two sites for Cedar Rapids are located.

My research shows the following info about each system, and I'll compare the performance of each.

Colorado: Daniels electronics base stations, unknown user equipment.
Colorado Springs: Cqpsk with 4 simulcast sites
JoCo: Harris base and mobile portable. Cqpsk with 6 sites.
CR: Motorola base and mobile portables. C4FM with 2 sites.

Linn County: Planned Harris base and mobile portable with multiple sites, planned 700/800mhz and plans interface with state of Iowa.
Currently on VHF repeaters.

Now let's talk about the performance for each.
For each digital mode the receiver is a 396xt.

Observation points: NE side of Cedar Rapids, or NE end of Benton county and I-380 between I-80 and US-20.

My observations for each system:

Colorado springs:
Detected 115 miles out, 5600ft with 4 bases at 7200feet
Simulcast is assumed but has no carrier hetrodyne effects noted.
No periodic chopping or garbling, audio quality good, no echo effect.

No analog use noted or possible.

Cedar Rapids:
Solid coverage for 10 miles, some small amount of echo and breakup, analog always has a DPL rate heatrodyne but at low levels.
Trunking is difficult at 17 miles out, subject to propogation changes the control channel fades in and out, P25 broken to good, some "self interference" effects are noted at 0.5 to 1 hz rate, some echo and chop at maximum range, but pretty good in close. If you fish for a spot where the hetrodyne between two towers is maximized, its pretty broken up.
Method used: Program the control channel to a conventional test bank in AM mode, and maximize AM beat effect.

Johnson County:
Initial impression was it is an incompatable format such as mototrbo as it would not decode the control channel, as such was ignored.
Further news reports and lack of activity on their old channels led to further investigation.
Taking a closer look in analog, it was found to be a cqpsk but with a 1.7hz AM component.
Beams indicate a site to the SE of Cedar Rapids.
So Radio Reference info was loaded into the 396xt and on a trip by johnson county some broken audio was detected, but seemed to be reading encrypted, with very occasional clear.
I queried the JoCo supervisors who didn't know much about it but forwareded the query to someone in the comms division who said which channels are clear, most of them except 10-28's but not the main, fire, etc.

OK so I gave this a try again for a week or two. I found that yes the groups are clear but very rarely decoded.
I have noted fairly good reception next to Cedar Rapids Airport.
It turns out they have a 6th site very near the airport.

Upon further investigation it was found there were not only 2 sites in this system but 6!!! Astounding. And there's lots of signal but poorly decoded.

For the next trouble shooting step I connected to a 15 element Yagi, and maximized the strongest site, isolated the other sites and connected the digital scanner. Alas finally it decoded and tracked the system. With analog AM I found I pick up at least 3 of the sites, which when mapped out shows 2 in north Johnson county and 1 central site thats on high ground.

When beamed in on the best site, Range 20 garbling and echo minimal but occasional, system fades in and out.

I have noted each site is on a slightly different carrier freq but within 2hz. Most places in Linn County have 2 sites about the same level so they mix together, they are within 30% of the same level. Omni reception is poor to fair depending on being closer to one site or the other.

Now let us compare to some known single site systems.
Montana has one site on VHF on a mountain. Had great coverage even to the bottom of the mountain valleys witin 3 - 5 miles and good coverage on any line of sight locations.

Wisconsin has a number of single site systems such as Granite Peak (wasau wi). Great coverage from the one site throughout that and the next county.
No chop echo or in analog any am modulation effects.

So let us summarize:

Single Site: More dead spots, but very clean otherwise.
Dual Site C4FM : Few dead spots but slight artifacts such as echo and chop, especially at the 15+_ mile mark.

Multi Site Cqpsk: Great signal level but depends on vendors.

Daniels as done in colorado: 115 miles (as soon as line of sight)
Harris as done in Johnson County: 20 miles if using directional antenna; 5 miles if using omni, more if in a place where one tower predominates.

Thats pretty dramatic. there's a ton of signal but the system interferes with itself.

I think what's going on here is a [serious] design flaw in Harris' implementation.
Motorola is the first vendor I've heard of using "simulcast"
C4FM simulcast works fairly well because the decoder looks at FSK Freqency, and all towers are on the same shift at the same time,
So everyone developed "simulcast offerings" but some implementations work very well (Colorado/Daniels) and some don't(Harris).
So what is C4FM? Four frequency shift modulation.
And CQPSK? 4 phase shifts with some AM to reduce spectrum width.
To detect C4fm a different method is used that doenst depend on carrier phase.
To detect cqpsk the phase of the incoming carrier is decoded.

If the incoming carrier is two signals of nearly equal amplitude but different carrier frequency then the decoder will try to lock in one carrier then the other, or a mix between the two. Maybe Harris has receivers that will work with 2 carriers combined together that are off frequency.

It's fairly easy to detect this condition, when tuning to the control channel in AM analog one can hear what appers to be a control channel with AM on it.
Cqpsk has a rather strong 4800hz component to it, and one effect as a beam antenna is rotated is the fades become very high as the two towers become equal in amplitide. The fades occur at the hetrodyne rate between the towers. This is 1.7hz at 851.050 mhz in this case.

So why does the Daniels system work at 115 miles and the Harris work at 5 miles?

Because there was no perceived carrier frequency offset on 4 towers that were in use there in Colorado, or their system only transmits on one site at a time.

In the Harris system, the carriers are within 2 hz of each other.

At 851.05 there is no doubt a reference in all the base stations such as a TXCO, which is multiplied up. So the 2hz translates to an error of .001parts per million, pretty hard to set up in a crystal or measure, takes a long time to set it that close.

In the Daniels system, either they don't transmit more than one place or they use a time base reference at each base station such as a rubidium standard or a gps synchronized time

standard, for all the synthesizers.

I know Harris is not doing that, becuase of the analog beat note.

I find all this interesting because I use my trunking radios for my own news, health, property protection and welfare.
I don't like to see radio systems I use that work poorly.
My argument to the county here is they need to check this out before they allow Harris to put the same defective design into our county.
I believe they were budgeted at 17.8 million for a system like Johnson County's.

According to a newspaper in Johnson County, someone in the communications division resigned recently. Perhaps it has something to do with my observations and research.

Some other observations:
A scanner user in Johnson County wonders what is wrong with his scanner program.
Another poster on the groups observed Indianapolis has a simulcast system and its users have a tough time with it.
Harris responded initially and has not given an answer to my query's.

Chris;

Thanks for this analysis. I wonder what your findings would be on the Colorado Springs system from a distance of 15 miles.

I often get better reception of urban systems from a rural location where there is less RF pollution.

WOW, thats a excellent article you put together...I monitor the IL-Starcom 700/800 9600 Digital system, the stand alone towers we call them are perfect on receive, the simulcast 700mgz in the Chicago suburbs are a pain for me living 25 miles or more using out door "Channel Master Triband with LMR400-60'....I can go two blocks down the street with a rubber RS800 duck and they come in great plus, on any given day the weather conditions seem to change reception ....I been monitoring for over 40 years and the old VHF-UHF were a briese compared to these type's of setup....I use a 996XT, RS197, and my 396XT....I sold my GRE500 as it was so bad it would not decode much of anything in my location 30 miles SW of Chicago....

> Detected 115 miles out, 5600ft with 4 bases at 7200feet
> Simulcast is assumed but has no carrier hetrodyne effects noted.
> No periodic chopping or garbling, audio quality good, no echo effect.
> No analog use noted or possible.
>
> Cedar Rapids:
> Solid coverage for 10 miles, some small amount of echo and breakup, analog always has a DPL rate heatrodyne but at low levels.
> Trunking is difficult at 17 miles out, subject to propogation changes the control channel fades in and out, P25 broken to good, some "self interference" effects are noted at 0.5 to 1 hz rate, some echo and chop at maximum range, but pretty good in close. If you fish for a spot where the hetrodyne between two towers is maximized, its pretty broken up.
> Method used: Program the control channel to a conventional test bank in AM mode, and maximize AM beat effect.
>
>
> Johnson County:
> Initial impression was it is an incompatable format such as mototrbo as it would not decode the control channel, as such was ignored.
> Further news reports and lack of activity on their old channels led to further investigation.
> Taking a closer look in analog, it was found to be a cqpsk but with a 1.7hz AM component. Beams indicate a site to the SE of Cedar Rapids.
> So Radio Reference info was loaded into the 396xt and on a trip by johnson county some broken audio was detected, but seemed to be reading encrypted, with very occasional clear.
> I queried the JoCo supervisors who didn't know much about it but forwareded the query to someone in the comms division who said which channels are clear, most of them except 10-28's but not the main, fire, etc.
>
> OK so I gave this a try again for a week or two. I found that yes the groups are clear but very rarely decoded.
> I have noted fairly good reception next to Cedar Rapids Airport.
> It turns out they have a 6th site very near the airport.
>

> Upon further investigation it was found there were not only 2 sites in this system but 6!!! Astounding. And there's lots of signal but poorly decoded.
>
> For the next trouble shooting step I connected to a 15 element Yagi, and maximized the strongest site, isolated the other sites and connected the digital scanner. Alas finally it decoded and tracked the system. With analog AM I found I pick up at least 3 of the sites, which when mapped out shows 2 in north Johnson county and 1 central site thats on high ground.
>
> When beamed in on the best site, Range 20 garbling and echo minimal but occasional, system fades in and out.
>
> I have noted each site is on a slightly different carrier freq but within 2hz. Most places in Linn County have 2 sites about the same level so they mix together, they are within 30% of the same level. Omni reception is poor to fair depending on being closer to one site or the other.
>
> Now let us compare to some known single site systems.
> Montana has one site on VHF on a mountain. Had great coverage even to the bottom of the mountain valleys witin 3 - 5 miles and good coverage on any line of sight locations.
>
> Wisconsin has a number of single site systems such as Granite Peak (wasau wi). Great coverage from the one site throughout that and the next county.
> No chop echo or in analog any am modulation effects.
>
>
>
> So let us summarize:
>
> Single Site: More dead spots, but very clean otherwise.
> Dual Site C4FM : Few dead spots but slight artifacts such as echo and chop, especially at the 15+_ mile mark.
>
> Multi Site Cqpsk: Great signal level but depends on vendors.
>
> Daniels as done in colorado: 115 miles (as soon as line of sight)
> Harris as done in Johnson County: 20 miles if using directional antenna; 5 miles if using omni, more if in a place where one tower predominates.
>
>
> Thats pretty dramatic. there's a ton of signal but the system interferes with itself.
>
> I think what's going on here is a [serious] design flaw in Harris' implementation.
> Motorola is the first vendor I've heard of using "simulcast"
> C4FM simulcast works fairly well because the decoder looks at FSK Freqency, and all towers are on the same shift at the same time,
> So everyone developed "simulcast offerings" but some implementations work very well (Colorado/Daniels) and some don't(Harris).
> So what is C4FM? Four frequency shift modulation.
> And CQPSK? 4 phase shifts with some AM to reduce spectrum width.

> To detect C4fm a different method is used that doenst depend on carrier phase.
> To detect cqpsk the phase of the incoming carrier is decoded.
>
> If the incoming carrier is two signals of nearly equal amplitude but different carrier frequency then the decoder will try to lock in one carrier then the other, or a mix between the two. Maybe Harris has receivers that will work with 2 carriers combined together that are off frequency.
>
> It's fairly easy to detect this condition, when tuning to the control channel in AM analog one can hear what appers to be a control channel with AM on it.
> Cqpsk has a rather strong 4800hz component to it, and one effect as a beam antenna is rotated is the fades become very high as the two towers become equal in amplitide. The fades occur at the hetrodyne rate between the towers. This is 1.7hz at 851.050 mhz in this case.
>
> So why does the Daniels system work at 115 miles and the Harris work at 5 miles?
>
> Because there was no perceived carrier frequency offset on 4 towers that were in use there in Colorado, or their system only transmits on one site at a time.
>
> In the Harris system, the carriers are within 2 hz of each other.
>
> At 851.05 there is no doubt a reference in all the base stations such as a TXCO, which is multiplied up. So the 2hz translates to an error of .001parts per million, pretty hard to set up in a crystal or measure, takes a long time to set it that close.
>
> In the Daniels system, either they don't transmit more than one place or they use a time base reference at each base station such as a rubidium standard or a gps synchronized time standard, for all the synthesizers.
>
> I know Harris is not doing that, becuase of the analog beat note.
>
> I find all this interesting because I use my trunking radios for my own news, health, property protection and welfare.
> I don't like to see radio systems I use that work poorly.
> My argument to the county here is they need to check this out before they allow Harris to put the same defective design into our county.
> I believe they were budgeted at 17.8 million for a system like Johnson County's.
>

From: gabrielddc
Topic: 6674 Message: 6674

I would like a help.
I have a BCD396xt but in my country does not have a place to find the frequencies and trunk systems .
I found this system but I can´t find which system is.
Could someone try to listen in the video that I posted on YouTube?http://www.youtube.com/watch?v=ZWSzjR-6FgQ

Also, there is a control channel:
http://www.youtube.com/watch?v=ptBafebsMSM

Can BCD396xt follow this system?

Thanks a lot for any help.

We need more information to help you out. From the video I will assume you are in Dayton Ohio so here's the links to the Dayton Ohio trunked system: http://www.radioreference.com/apps/db/?sid=4
Here's Montgomery County trunked system:
http://www.radioreference.com/apps/db/?sid=406

In order to use software like freescan to program your 396xt easily you will need to subscribe to radio reference and also get the usb->serial cable for the 396xt.

"I would like a help.

Well I did transit across Denver as well never noting the frequency offset artifacts found on the Harris Johonson county system. The Daniels electronics design doesn't have frequency offsets on their sites where there is more than one site on the same set of frequencies. Maybe Harris radios are able to cope with that offset but don't try to put another brand radio on their Simulcast sites it will have problems. One could argue they are incompatible with the P25 standard in some way.
Colorado Springs is part of the DTRS system (statewide linking) and if I lost a signal out there its because it faded out behind a mountain. If there were simulcast sites as implied by the Colorado Springs license, you couldn't tell. I put in 74 DTRS sites and most of them were single site, where they reused frequencies then those sites appear to be several hundred miles apart. I only put in sites for the counties I planned to visit on my trips, and they had a little garbling when they were fading out of the system. You can recognize co channel frequency offset interference of the Cqpsk system by a periodicity in the decoded audio. First the control channel must be tuned in analog. Then any hetrodyne effect such as low rate AM modulation of the AM component is charactarized. Then the scanner is set to digital scan. When a transmission occurs, errors such as audio chop or echo will occur at the same rate as the AM modulation.
While transiting 2/3 of Colorado no such sites were heard.
Nothing was very strong as they put the sites on mountains, so they are at least a few miles away. YOu can see their setups if you get the lat/long of a site then go look at that lat/long on google earth. Kind of looks like they use 90' bay antennas like cell systems. They shoot them down the mountain and it covers at least 115 miles.

If you are getting "nextel-I" they use pulsed RF on the talk channels, you can recognize that pretty easily. I get that a little bit on some analog 800 systems. Also note 4g is springing up in the 740-770 range with pulsed waveforms, you will notice that on some radios.

Jeff,
Thanks a lot for your information.
I found some samples of transmissions and I found, It is a MPT1327 system, and our BCD396XT can´t follow the system.
The good news is that there ara a software to do this, the name is TrunkView
http://www.linato.net/trunkview and it´s compatible with uniden.
Thanks!!!!

6678. Novice Question On Scanner Function

Yahoo group: BCD396XT (2011 — 2014)

From: Ken Craig
Topic: 6678 Message: 6678

Apologies for what is probably a simpleton question for the extremely knowledgable folks on this group, but I'm stumped.

I'm a director of a community patrol and we procured a BCD396XT and had it programmed by the selling company to cover our police and fire channels. Worked just find for three weeks until it was returned after one patrol and didn't seem to be picking up any traffic at all. It appears to be ID Scanning properly and if we press the [Hold] button it suddenly produces traffic for the specific channel it stops on, but when we return to scanning it doesn't provide any traffic at all.

I'm sure it's something fairly simple, but I've been searching the "over my head" documentation trying to figurte it out for over a week, and have searched the files and posts on this group but not had any success yet.

The Display shows ID SCAN on the third line, NFM on the fourth and shows the two SO: groups we're trying to monitor - but no sounds. Can anyone help. I promise to LOCK the darned keypad once we get this thing working again.

Any help would be GREATLY appreciated!

Sincerely,

Ken

Check the squelch and it should be no more than 2 bars! Also check to make certain the ATTEN(uator) has been turned on accidently or that the channels are not locked out. Those are the first 3 things to check.

Ok, you say "ID Scanning" so that sounds like it is a trunked radio system. In that case, when you press HOLD you should be hearing the control channel noise, not voice traffic. It is possible that there was a change on the system itself or that the place that programmed it missed a control channel.

Really, beyond that is just wild blue guessing. You really didn't provide the minimum info needed to go further (that being which system and which channels...a pointer to the system at RadioReference.com would be helpful, too).

Thanks for your suggestions John.

The squelch is set at 2 bars and the channels are not locked. I'm such a newbie with this scanner, that I can't figure out how to check the ATTENuator. [F]+[ATT/7] don't seem to provide access to those setting, and I don't see anything under the menu leading to ATTENuator? I appreciate the attempt :)

I appreciate your reply UPMan/Paul. I had the scanner pre-programmed by ScannerMaster largely because I know so little about them other than turning them on and off, to be honest :(

I'm in San Francisco, listening to SFPD and SFFD channels which I believe are trunked. All was fine for a month when we received the scanner, then the "glitch." I'm not sure enough about the diffrence between control channel noise and voice traffic, but when the scanner is on and I tap the HOLD button, I can hear both sides of the conversation on the PD channel from dispatch and the field unit, but when I take the HOLD off and the scanner returns to scanning all of the PD channels, it doesn't stop on any transmissions at all.

This probably doesn't help much :(I kinda wish there was an "Idiots Guide" book lol.

Per this site,
San Francisco was very recently rebanded.
Go here http://www.radioreference.com/apps/db/?sid=60
Somebody in your group (or you) will have to learn a little more about scanning and the fine BCD396XT .
There are several computer programs for programming the scanner.
Join the Yahoo Group and somebody will probably assist you.
http://groups.yahoo.com/group/SCANnorCAL/

6685. Followup: More proof synchronization of the RF is needed: Re: [BCD396XT] Serious issues found with the Harris "simulcast" P25 Cqpsk system

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-05-26 18:30:42 UTC
From: chris451
Topic: 6671 Message: 6685

Followup:
The Colorado springs system is simulcast and does use time based
synchronization.
From a daniels newsletter:

P25 Simulcast
At IWCE 2012 in Las Vegas (Feb 22) Daniels Electronics will be
introducing its new P25 Simulcast
solution. Building on the P25 Voter announced at APCO (see above) the
P25 Simulcast solution
allows a single P25 signal to be simultaneously broadcast using two or
more geographically
separated radio transmitters. For each transmission in the simulcast
system, the Simulcast
Controller sends the same signal with a timing offset with respect to a
1 Hz synchronization
reference to each transmitter via an IP network.
Each Simulcast transmitter is configured with an additional timing
offset that may then be applied to
the transmitted signal, allowing tuning of the system by geographically
shifting areas where the
signals are destructively reinforcing. A network time protocol (NTP)
from a GPS or an Internet
connection is required for proper simulcast operation.

Many places that sell the 396xt also sell a GPS kit? I thought the scanner had GPS functionality?

Many places also sell the base radio, THEN you add counties pre programmed. I thought that you can download software and data from Radio reference and program the unit yourself without much problem ?

The scanner supports GPS features, but has no GPS built-in.

It would be nice if it were a built-in option, but
GPS functionality is not as popular as it is on mobiles.

6688. FreeSCAN 2.11 Available

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-05-27 20:14:53 UTC
From: Brian
Topic: 6688 Message: 6688

[Forward]

FreeSCAN 2.11 Available
==========

It's been a while since the last version came out, but having found some free lately, 2.11 is
available with several improvements.

-New:Audio Recording has been reworked. It should now operate more reliably across different
systems. Note: You may have to reset your audio recording settings after installing this version.
-New:Redesigned GPS System Plotter. You can now view multiple systems at once, among other improvements.
-New:You can now resize the columns in the "Review" part of the log viewer
-New:Right-click on the log viewer to see a file in Windows Explorer
-Fixes an issue with the U.S. flag in RR Import directing to the next country instead of the US
-Fixes an issue with importing NAC codes from RR
-Added a warning about trying to import unscannable (by supported scanners) P25 Phase 2 Systems
-Other bug fixes and improvements

Visit Sixspot Software and the Downloads section to get this new version.

Go into the menu "edit custom", scroll to Custom search 4, scroll to "search with scan", choose "LOCKOUT" and its gone with your regular scanning....

The easiest way is to hit FUNC then the L/O
button twice while scanning that search range.

For trunked radio systems, SQKs are assigned at the Site level (S=Site). To turn off scanning for a trunked system, you disable all the site quick keys.

6696. 396XT not tracking individual calls on Tait P25 system?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-05-30 18:21:59 UTC
From: Jeremy
Topic: 6696 Message: 6696

A P25 system is currently being installed in the Portland, Oregon area for the local transit agency to replace existing 450 and 800 systems. The system is manufactured by Tait. I have been able to track group calls on the system just fine with my 396XT, however when they switch over to individual calls I am not able to hear them, unless I scan them conventionally with another radio. If I park the radio on the control channel I am unable to see any activity, unless there is a group call going on as well. I have put the individual call wildcard in the scan list, with no change. I have not tracked an individual call on any other P25 systems, as we don't have many P25 systems in this area in active use yet, so I don't know if the scanner will track it on a Motorola or other manufacturers P25 system. Unfortunately it sounds like this system will make alot of use of individual calls.

Another interesting thing to note is that when watching this system with Pro96.com software the individual call conversation shows up for about 1/2 second or so before it disappears, even though the conversation is still going on. Is this a bug that can be looked at for a future firmware upgrade? Thanks

Jeremy

I have the same problem in E Idaho. Uniden scanners don't seem to be able to track i-calls when Tait radios are involved, although I don't know exactly why. I have also heard this from other Uniden owners on other P25 Tait radio systems. GRE scanners seem to track the i-calls OK. Unidens should track i-calls ok on Motorola P25 systems.

6698. Re: Serious issues found with the Harris "simulcast" P25 Cqpsk system

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-06-01 17:51:16 UTC
From: chris tofer
Topic: 6671 Message: 6698

I got a letter from a consultant for the county forwarded to me.
They say there are 3 new standards added to the P25.
These were added because Motorola changed their waveform to work better with simulcast and enable the radios to decode 2 or 3 towers at the same time and add the signals together and clean up the time delay and possibly the frequency offset. Harris pressed on them to open up what they were doing so all vendors could roam on each others systems. The processing is probably not present in the GRE and Uniden did an update on the digital scanners that "allows better reception of simulcast systems" which may mean they added the waveforms to their decoders. Not sure the Uniden will combine two signals together unless they are zero beat. The suggestion I got from them was they were going ahead with the system as is since the radios they are buying will work. I suggested they buy the gps time reference for all their towers if available. That it would greatly improve the way their radios work on the system.

In the letter they admitted digital coverage was half of what the analog coverage was. (The selling point was that it would be better)

So I plan to pick apart that letter and look at the refrences maybe call them and have a few more rounds with the county supervisor about it. The letter did not satisfy me that's the best they can do. They really need the time standards. The uniden scanner has a tough time decoding with a 2 hz frequency offset between the two towers. It sounds like Harris radios have processing that will lock in on that much. I'm not sure the freq offset tolerance is in the spec or if I can even get to it without paying the big bucks.

channel fades in and out, P25 broken to good, some "self interference" effects are noted at 0.5 to 1 hz rate, some echo and chop at maximum range, but pretty good in close. If you fish for a spot where the hetrodyne between two towers is maximized, its pretty broken up.
> > Method used: Program the control channel to a conventional test bank in AM mode, and maximize AM beat effect.

6699. P25 Decode Adjustments

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-06-01 22:54:20 UTC
From: Alex
Topic: 6699 Message: 6699

I'm still having some trouble with P25 decode on systems after the most recent firmware update that altered P25 and added the hidden menus. The audio breaks up at times as the radio tries to zero in and decode or just fails to decode at all. From the decoder information screen (F-Vol twice) I see that the decoder level makes its way up to 11-12 from a starting point of 8 in automatic mode and the errors sometimes climb to 17-18.

Are the P25 adjustments a trial-and-error process or is there a method to the madness? Is it possible to fix the level at something other than 8/Auto to make the decode more reliable?

6700. RE: [BCD396XT] P25 Decode Adjustments

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-06-01 23:18:42 UTC
From: Robert Klamp Jr.
Topic: 6699 Message: 6700

Ive been working with the p25 adjustment modes and have found that they do help. Unfortunately no two systems are the same or at least that what it seems like where I live in Illinois near Chicago. So it does come down to trial and error, I changed the value by increments of 5 up and down to find which way the value needed to go. I would go 5 to 15 increments above the original value then do the same for levels below the original value, you will be able to notice a sizeable change in your decode rate when you start adjusting the level the right way. From there it is a process of fine tuning your p25 values to a value that works the best on your system. It may take a while and alot of testing but if you take your time and document your results so you know what you've changed and what needs to be changed I think you will be very happy with your final product.

Hope this helps,
Bob

Subject: [BCD396XT] P25 Decode Adjustments

I'm still having some trouble with P25 decode on systems after the most recent firmware update that altered P25 and added the hidden menus. The audio breaks up at times as the radio tries to zero in and decode or just fails to decode at all. From the decoder information screen (F-Vol twice) I see that the decoder level makes its way up to 11-12 from a starting point of 8 in automatic mode and the errors sometimes climb to 17-18.

Are the P25 adjustments a trial-and-error process or is there a method to the madness? Is it possible to fix the level at something other than 8/Auto to make the decode more reliable?

I have found that one system decodes best at 7,one at 8, another at 11 and one at 12. It is trial and error, and other things too. Even weather affects things as does the season. Just a bit of wind throws one system all over the place. You really need to let it sit a while, an hour or more and watch the error rate. It should be as low as possible.

Folks let's take a deep breath and step back to look at the big picture here:

NO SCANNER IS OPTIMIZED FOR P25 RECEPTION.

Scanners are built to do a whole lot of different things (decode FM in multiple formats, decode AM, & follow 4-5 or more different trunking systems such as LTR, P25, P16, EDACS to name a few; in addition to detecting CTCSS/CDCSS tones in conventional mode) at a BASIC level. We haven't even touched on the Uniden Fire Tone-out decoding and the ability of both manufacturers to decode weather alerts from analog and AFSK tones.

Professional radios are usually built to operate in a single RF band segment (VHF, UHF, 700/800) and transit and receive in conventional and trunked formats depending on the firmware (think operating system) installed. The combination of formats will be limited to the system types the manufacturer supports.

Neither the Uniden or the GRE scanners have anything like a commercial or public safety level receiver; never have, never will.

I have service information on the Radio Shack/GRE scanners. These units utilize a Texas Instruments "Low Power Mono Voice Band CODEC" chip to do the digital to analog signal conversion and a Texas Instruments fixed point digital signal processor for decoding of multiple formats. These chips rely on firmware programming to tell them how to operate. In effect what has been done is that GRE has found a way to decode the P25 signal WITHOUT using copyrighted products from DVSI which are used in commercial designs. Because thay are using a back door approach, much of what makes P25 work in professional equipment is NOT available. There have been some updates but the last time I checked the DSP portion of the GRE units is at DSP version 1.0 and none of the updates was higher than version 1.4.

I suspect that Uniden uses similar devices and approaches but I haven't had an opportunity to open up one yet and service information is nonexistant.

Contrast this with a subscriber unit on a P25 trunk system. These radios are purpose built to operate in a single RF band on a limited range of radio system types. A P25 radio can also operate in conventional mode. It is not going to operate on an LTR trunked system.

Having had some training on the early versions of Motorola Astro products I know that there is a whole lot more that goes on in detecting the signals in a professional radio that operates on a P25 environment than what happens in a scanner receiver. The professional equipment uses a method of compressing

the digital information in the transmitter along with error correction that is sent with the transmitted signal and then utilized at the receiving end to error correct and decompress the data before it is converted to analog audio.

Remember that not that long ago receiving AM Aircraft required a seperate scanner or tunable receiver designed for VHF AM reception. Receiving CB transmissions required a CB radio. Take another look at the range of frequencies that your scanner receives; it's rather amazing. In order to accomplish this wide range there is no filtering on the receiver front end. A professional radio has filtering that is specific to the RF range for which the radio is built.
We have gained a lot but with all the technical advances there have been a lot of technical sacrifices.

In the professional market specifically relating to P25, each manufacturer strives to deliver a product that meets the required basic specifications BUT each manufacturer is allowed to add onto the specifications in order to offer unique additions that are proprietary to their product line. If the specification is modified to include a feature that was developed by a single manufacturer then logic says that that manufacturer will want to have a return on their investment; the information will not just be handed out. Since most of the newer equipment is controlled by firmware each manufacturer has to find a way to incorporate the features they want to provide into whatever devices that they have chosen to use to control their radios without violating copyrighted procedures or by paying licensing fees to incoporprate features developed by others. A lot of time goes into this development and changes are not a simple matter.

Realistically we are lucky that the scanner manufacturers perceive that there is enough of a market for their products and are willing to mess around and do the research to find ways to receive the P25 signals and other systems and roll them all into a single package.
They are NOT connected to the major manufacturers of radio equipment and since licensing fees for the digital systems that form the backbone of the P25 environment are significant, the only way to bring product to market at pricing levels that are within the consumer range is to be creative. Don't expect high end performance out of a scanner.

Frequency and time offsets are a part of the setup of any simulcast system, which is in itself a complete sub-specialty of the radio art. With the proper planning and implimentation in addition to continuing upkeep and maintenance a simulcast system will work well. Remember that the design of a radio system is based on the users of that system, their equipment, and a specific geographical service area. Casual reception is NOT part of the design. Reception outside of the specific geographical area is not part of the design. In other words the system is designed for the users, not the listeners. Due to revisions in licensing requirements and improvements in system design the days of high powered, high altitude systems that were easy to listen to are rapidly becoming a thing of the past.

I think your wrong there Milton..... considering Uniden allows you to change the settings to OPTIMIZE the P25 settings so it decodes better.

Subject: Re: [BCD396XT] Re: Serious issues found with the Harris "simulcast" P25 Cqpsk system

Folks let's take a deep breath and step back to look at the big picture here:

NO SCANNER IS OPTIMIZED FOR P25 RECEPTION.

Scanners are built to do a whole lot of different things (decode FM in multiple formats, decode AM, & follow 4-5 or more different trunking systems such as LTR, P25, P16, EDACS to name a few; in addition to detecting CTCSS/CDCSS tones in conventional mode) at a BASIC level. We haven't even touched on the Uniden Fire Tone-out decoding and the ability of both manufacturers to decode weather alerts from analog and AFSK tones.

Professional radios are usually built to operate in a single RF band segment (VHF, UHF, 700/800) and transit and receive in conventional and trunked formats depending on the firmware (think operating system) installed. The combination of formats will be limited to the system types the manufacturer supports.

Neither the Uniden or the GRE scanners have anything like a commercial or public safety level receiver; never have, never will.

I have service information on the Radio Shack/GRE scanners. These units utilize a Texas Instruments "Low Power Mono Voice Band CODEC" chip to do the digital to analog signal conversion and a Texas Instruments fixed point digital signal processor for decoding of multiple formats. These chips rely on firmware programming to tell them how to operate. In effect what has been done is that GRE has found a way to decode the P25 signal WITHOUT using copyrighted products from DVSI which are used in commercial designs. Because thay are using a back door approach, much of what makes P25 work in professional equipment is NOT available. There have been some updates but the last time I checked the DSP portion of the GRE units is at DSP version 1.0 and none of the updates was higher than version 1.4.

I suspect that Uniden uses similar devices and approaches but I haven't had an opportunity to open up one yet and service information is nonexistant.

Contrast this with a subscriber unit on a P25 trunk system. These radios are purpose built to operate in a single RF band on a limited range of radio system types. A P25 radio can also operate in conventional mode. It is not going to operate on an LTR trunked system.

Having had some training on the early versions of Motorola Astro products I know that there is a whole lot more that goes on in detecting the signals in a professional radio that operates on a P25 environment than what happens in a scanner receiver. The professional equipment uses a method of compressing the digital information in the transmitter along with error correction that is sent with the transmitted signal and then utilized at the receiving end to error correct and decompress the data before it is converted to analog audio.

Remember that not that long ago receiving AM Aircraft required a seperate scanner or tunable receiver designed for VHF AM reception. Receiving CB transmissions required a CB radio. Take another look at the range of frequencies that your scanner receives; it's rather amazing. In order to accomplish this wide range there is no filtering on the receiver front end. A professional radio has filtering that is specific to the RF range for which the radio is built.
We have gained a lot but with all the technical advances there have been a lot of technical sacrifices.

In the professional market specifically relating to P25, each manufacturer strives to deliver a product that meets the required basic specifications BUT each manufacturer is allowed to add onto the specifications in order to offer unique additions that are proprietary to their product line. If the specification is modified to include a feature that was developed by a single manufacturer then logic says that that manufacturer will want to have a return on their investment; the information will not just be handed out. Since most of the newer equipment is controlled by firmware each manufacturer has to find a way to incorporate the features they want to provide into whatever devices that they have chosen to use to control their radios without violating copyrighted procedures or by paying licensing fees to incoporprate features developed by others. A lot of time goes into this development and changes are not a simple matter.

Realistically we are lucky that the scanner manufacturers perceive that there is enough of a market for their products and are willing to mess around and do the research to find ways to receive the P25 signals and other systems and roll them all into a single package.
They are NOT connected to the major manufacturers of radio equipment and since licensing fees for the digital systems that form the backbone of the P25 environment are significant, the only way to bring product to market at pricing levels that are within the consumer range is to be creative. Don't expect high end performance out of a scanner.

Frequency and time offsets are a part of the setup of any simulcast system, which is in itself a complete sub-specialty of the radio art. With the proper planning and implimentation in addition to continuing upkeep and maintenance a simulcast system will work well. Remember that the design of

a radio system is based on the users of that system, their equipment, and a specific geographical service area. Casual reception is NOT part of the design. Reception outside of the specific geographical area is not part of the design. In other words the system is designed for the users, not the listeners. Due to revisions in licensing requirements and improvements in system design the days of high powered, high altitude systems that were easy to listen to are rapidly becoming a thing of the past.

Topic: 6704 Message: 6704

Gidday All,

Will the UBCD396XT decode the Icom based amateur Dstar ?

Regards,

Doug VK2XLJ

Nothing will except another D-Star radio.

Or a PC, DV Dongle and some open source software working together
(you will need a radio with a discriminator output for this to work).

Looking for a good mobile antenna to use in my van. I mainly listen to OPP and Metro Police. I do not want to drill holes in the van etc. Just something for around $50 or so that does a good job. Anyone have any experience with the scanner master spectrum-force mag mount?

I've had really good luck with the Hustler MOT antenna. It's very
inexpensive, durable, and receives well. They make a magnetic version
that's a few dollars more. I think it's the MRM.

And technically speaking (AKA picking nits), D-STAR is a JARL format,
not Icom. Icom just happens to be the largest (but not only) promoter of
the format outside Japan.

Actually there are D-STAR dongles out there
that you can hook up to any radio or scanner.

If DVSI ever releases the code for the AMBE codec used in the radios then any radio like the 396XT could do it in its firmware.

Who else is promoting D-STAR? Other than Icom I haven't seen any manufacturer interested in using it. Kenwood and Yaesu/Vertex have held back (probably a wait-and-see).

The specification of the P25 versions are published. That option has always been there ...

Winradio offers PC based decoding of IMBE. Don't know if they support dstar.

I believe you're right that aren't any radio manufactures even though Kenwood said they would and had a radio (built by Icom) initially that they since dropped. There are other manufactures providing a dongle option for use on a computer.

Personally I don't understand how the FCC permitted this D-Star for Amateur Radio. My understanding is that is it a licensed technology and not open and free for anyone to use. This makes it more like an encrypted/scrambled private transmission as well as a commercial pay to play option which are counter to the basis of the hobby. I am sure this is also a big part of its slow growth.

All the manufacturers have to do is include the right chip in their scanner to handle the AMBE audio (same as they do for IMBE that P25 uses). Probably be one that can do both formats, since both are DVSI products. The test of the D-STAR spec is open, and can (and has!) be implemented by third parties.

Kenwood sells D-STAR radios in Japan. They have not marketed
it in the USA (likely due to their market potential research). Upon
further research, it looks like Kenwood has pulled out of the Japanese
market.

I'm sure it would be a similar decision on Uniden's part (for the USA
market). They have to look at the cost vs sales increase realized by the
availability of the format. From what I understand, they were offered a
license for OpenSky, but decided it was too high cost for the additional
market increase. Other scanner manufacturers likely came to the same
conclusion. Between the small market for Open Sky and the system issues
which threaten its future, it's probably not worth the investment.

While D-STAR has a much wider market base, it is really restricted to
ham radio which is not a big selling point for scanners. Most people
want scanners to monitor public safety agencies, not hams.

I think the big issue with its slow growth are the benefits vs cost issues. Most people have analog equipment. Relatively few have D-STAR. So, in an emergency it will be primarily analog that will be useful.

Also, there is a difference between digital and encrypted. D-STAR is not encrypted in any form, so it's legal per Part 97. You can purchase a dongle and monitor the conversations.

6720. RE: [BCD396XT] Mobile Antenna

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-06-04 22:55:47 UTC
From: Robert Klamp Jr.
Topic: 6708 Message: 6720

I have used the exact antenna you are referring to from scanner master and it works very good. After I got my new car I didn't want to put the big mag mounts on it any more and I sure wasn't going retro fit a 2011 Cadillac truck with the radio from my old car. So I bought the spectrum force mag mount to use with my hand helds while driving. The magnet on the antenna is super strong, it stayed on the car while doing 65-70 mph on the hi-way and even stayed on when I forgot to take it down once when entering a parking garage. I could hear it banging on every low point of the garage I went through and when I got out it was still standing and receiving like a champ for a cheap part time mobile antenna that you can take on and off at will with no damage to your car you cant beat the spectrum force. Also its frequency coverage is amazing VHF-900MHz it receives solid. I would definitely recommend it it even did OK on the vhf lo band. I hope this helps with your decision.

Just my opinion,
Bob

Subject: [BCD396XT] Mobile Antenna

Looking for a good mobile antenna to use in my van. I mainly listen to OPP and Metro Police. I do not want to drill holes in the van etc. Just something for around $50 or so that does a good job. Anyone have any experience with the scanner master spectrum-force mag mount?

Technically you are correct D-STAR is open but the codec is not and requires a license to decode so in function it is essentially 'encrypted/scrambled'. Yes, you can purchase a dongle but it is still using a license Codec that you paid for. You can't legally reverse engineer the Codec and listen or transmit. The cost benefit is a big part of the issue and with just one manufacture using it does not help. If there were more options and free/open Codec in use it would be much further along in growth and acceptance.

I feel a similar thing is happening with HD Radio. There are plenty of broadcasters but unfortunately not many radios with it built in. The car radio is becoming common to have HD. If you want to listen to HD on the beach or park where a small portable radio would be used or even in a home stereo or A/V receiver your options are very limited.

This could go on but as for the original scanning question they need a license for the Codec it is a small audience for them to add the cost. Though as a Ham it would great to be able to monitor the D-STAR activity and maybe become convinced it is worth the cost.

About a year and half ago the club I was part of (before moving to a different city) invited a rep from Icom to come in and talk about their radios with the focus primarily on the D-Star radios. While the technology is impressive, I don't see it ever becoming wide spread in the hobby.

As Joe has pointed out, in an emergency it will be primarily analog that is used. Where I live ARES is part of the county's emergency plan so our communications need to be easily and inexpensively monitored by numerous agencies from local emergency services to the Red Cross. Costs of D-Star radios would prevent that.

Thanks for the feedback Dave; at least I know it's just not an isolated incident with the local TriMet system here in Portland, Oregon. Guess we'll have to wait and see if any fixes are forthcoming? Not many systems seem to use Private Call in this area, even the older Motorola Type 2 systems.

Jeremy

I have the same problem in E Idaho. Uniden scanners don't seem to be able to track i-calls when Tait radios are involved, although I don't know exactly why. I have also heard this from other Uniden owners on other P25 Tait radio systems. GRE scanners seem to track the i-calls OK. Unidens should track i-calls ok on Motorola P25 systems.

PC board real estate is expensive, microcode space isn't. Given the component density already in the 396 I don't think it is quite so easy to cram one more chip in there. If Uniden really wanted D-STAR then they'd likely just license the codec algorithms and code that into the microprocessor just like all the other digital codecs that are currently processed.

From: Jeffry Rehm
Topic: 6726 Message: 6726

Trying to program, by hand, the Scott AFB (IL) TRS. It is listed as a Motorola Type II Smartnet but it is also a P25 system.

Do I program the system as P25 or as a Motorola system with each talk group programmed to receive digital only?

Also if I program the system (or site) in search mode in stead of scan mode is there anything tricky with that?

I have many trunked systems in my scanner but this one is, for some reason, giving me fits. Right now the only way I can hear voice traffic is to program the frequencies as a conventional system. At least that way I do get NAC 94 to show up on the screen.

Simply put I can't get the system to receive/decode any talk groups. I must be doing something wrong. Again I program everything by hand.

Thanks ahead for your help.

There is no single band plan for a systgem with those frequencies. They could all use different band plans.

That specific system''s band plan is shown on the RR database page:
http://www.radioreference.com/apps/db/?sid=4205

OK. So I am programming the band plan and the scanner is asking me questions that the answer does not appear on the Scott AFB page.

When I enter "base freq" all goes well but it then asks "input upper/input lower" what are those?

When I enter "offset" it asks for polarity (+ or -) that is not listed either. How do I know what it is?

The scanner does not seem to hold what little info I have in the memory for the band plan. I am guessing it is because I am not doing it correctly.

Again sorry for being a pain, just wanting to get it right.

I guess I better go and check the user manual huh?

6735. Software Question.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-06-06 19:23:53 UTC
From: mrhermit
Topic: 6735 Message: 6735

What software do owners of this scanner prefer to use?

I have found FreeScan, ProScan, ARCxt Basic, Arcxt Pro, bcTool, and Scancat lite Plus as programs that will work with this scanner.

I have the newest version of Scancat Lite Plus for use on my AOR 8000 analog scanner. I don't think it looks or works any better then it did about 10 years ago. I think it needs a new face lift. It is still back in the Windows 95 era.

I don't have this scanner, but it is on my possible list to buy. With the complexity of these newer digital trunk tracking scanners, I think that the software is an important part of using these scanners to there full potential. Any feedback, pros or con would be appreciated.

I personally use ArcXT Basic. If you are comfortable working with Spreadsheets this is the easiest one and has the most flexible editing capabilities IMO. I have tried Freescan and it is pretty good and is free. Both of these are easy to import from Radio reference with a paid membership. Last I checked Freescan and ArcXT Basic don't play well on the same computer so try with each one seperately (this could have changed).

PS I use ARC XT on Win 7 Pro SP1 64 bit with no issues.

I've downloaded and used both freescan and ARCxt Pro. I prefer ARCxt Pro, although it doesn't read well from Windows 7 to the scanner. I installed "XP Mode" in my windows 7, installed the software there and that resolved all issues.

I've been using Freescan. No complaints, it does the job for me. I
don't need to frequently change the frequencies, though one system
will be migrating to P25 sometime in the future.

Subject: [arc396] ARC XT PRO 1.8 with Radioreference search option

I have released ARC XT PRO V1.8.

I have added a new cool RadioReference search feature. From Virtual control you can now do a live RR
database search by double clicking a frequency in log grid.
This opens a new Windows where you can preset 3 different States and search those 3 States.
The search does require a premium subscription.
This search option is now also available in the Tools menu (ARC XT Basic & Pro)

Gidday Don,

Unfortunately that is a symptom of our instant society today.
People want everything to work now, and if it doesn't they want to be spoon fed
or done for them.

Technical and complex things take time to master, which require reading and research.

Regards,

Doug VK2XLJ

Anybody use the Maha Imedion NiMH AA 2400 mAh Low Self discharge batteries in their BCD396XT ?
The reason I ask is because a review states they are a little larger
in size than the Sanyo and might not fit all devices.

Otherwise the review gave good results.

I use the Imedion 2400 with my BC396XT and works great. It has a little tight fit bit works fine, so far no problems. I have been running these batts for about 6 months now with no issues. I have also found that these batteries fit a lot of other devices with a little tighter fit than regular AA batts but have not seen any issues.
Good luck.

6750. Uniden Repair..

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-06-23 08:52:18 UTC
From: mountain1
Topic: 6750 Message: 6750

Has anyone had any experience with Uniden warranty repair? I bought my 396xt in October and then a few weeks ago I noticed a bad smell coming from my briefcase. I opened it up and the battery compartment was completely deformed and warped! I've uploaded a pic showing what it looked like.

The radio had been off and not charging and the batteries were brand new! I just bought them a few days prior.

I called Uniden and they assured me this was definitely covered under warranty and that I should mail it to them ASAP!

I mailed it to them on the 5th and UPS says it was delivered on the 8th, but I didn't hear anything back from them. Finally I called on the 12th and they said they'd look around for it and let me know. On the 13th I called back and the woman said it was entered into the system but no update. She did give me an SRO number though.

Today is the 23rd, and I get a call from Gabriel saying that there is a remaining balance for repair and he left a number. I immediately called the number back as well as all of the customer service numbers on the website only to hear a recording saying that all of their phone systems were down!

So I have to ask, is this on par with everyone else's experience with Uniden? For a 500 dollar radio, I really expected MUCH better quality support and customer service than this.

If they can't make this right and soon, I'm pretty sure I'll never purchase a Uniden product again!

I suspect one of two things happened. Either your scanner developed an internal short, or more likely you had a cell short internal to the cell. The latter case likely would not be covered under warranty.

What brand cells were they?

I have had great luck with repair. I have sent a couple of scanners in over the last couple of years. They both came back in less than a month, even during the holidays. Both were out of warranty and repaired for the flat rate.
I am satisfied with them after 20+ years of Uniden.

Just some further info:

For about 3 weeks I had barely been getting an hour of scanning time whether using the stock batteries or Alkalines of all types. I called Uniden and they said that I should try NIMH instead of the Alkalines, and so I bought some Sanyo and Lenmars and was still getting less than an hour even while monitoring quiet stuff or in the middle of the night.

So I decided to try some Maha Powerex 2700 MAH. I used a battery tester http://www.goodbattery.com/MHSBT100.jpg and noticed they all showed good on the charge, so I just plugged them in and left the house.

I listened for about 20 mins on the drive, and then turned it off. About 30 mins later is when I smelled the horrid smell and noticed what happened.

Like I said, the radio was off and it wasn't charging in the scanner, and it was actually a pretty cool day, so I can't believe it overheated.

There was something definitely wrong long before this set of batteries though, and I really hope I can speak to someone at Uniden on Monday, because this lack of communication is very disheartening.

Actually, I am surprised that Uniden even has a repair department of more than two or three people. I have numerous, (maybe 60?) uniden scanners, Cb's, (Cobra) dating from the 60"s and up that I have used and abused. NEVER have I had one fail!

Please let us know what brand and type of batteries you were using at the time of failure.

Were all in radio community here...

All of the 2700 mah batteries i have seen are 1.5 Volts, where the 2600mah and lower are 1.2 volts, This is a .9 volt differance, maybe that's why it fried.... 1.5 v Alkaline do not heat up like the 1.5v rechargable 2700 mah. think the manual says something about only useing 1.2V rechargeables.I've never had a problem with Uniden service, always fast, courtious, and returned in less than a month, even at Xmas time.

"Ask not of your friends , That which your friends could not ask of you."
God Bless....

if he was having issues with fully charged batteries dying in less then an hour, in some cases 30 minutes, sounds to me like an internal short of the device.
This would also make sense for him putting in higher capacity batteries then the device really over heating.

Will the position of the "Alkaline / Ni-MH " switch have an impact on the cause of this issue?

It is unknown what the cause of the issue was, so it is unknowable what the position of that switch would affect.

6763. Re: Uniden Repair..

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-06-25 21:44:51 UTC
From: mountain1
Topic: 6750 Message: 6763

Further update:
Since asked, I used the stock batteries, Sanyo Eneloops, Lenmars, and the ones that were in it when the problem occurred were Maha MH-4AA270BH

http://www.mahaenergy.com/store/viewItem.asp?idProduct=415&cur=specs#mid

with the volt at 1.2, and the switch was set to NIMH.

The radio was off, not plugged in, and these were new batteries, never charged, but I do own a C900 and never charge in a radio. Kind of paranoid about doing that for exactly this reason.

I did talk to Mona at Uniden today and the general gist is that even though I had called before about the radio dying so fast and they recommended trying new batteries, it's the fact that this battery exploded that caused the actual damage. Why it exploded doesn't matter to them apparently, just the fact that it exploded means that the warranty doesn't cover it AT ALL.

If I had sent it in to them before the battery exploded, it would have been covered for free. ... Uh... great. Nice to know that after the fact.

I have also spoken with Eric Cheng at Maha, and he was very polite and simply said email him the bill and a photo of the radio and he'll send me out a package of replacement batteries and get back to me ASAP about covering the cost of the repair.

That is how customer service should be, quick, prompt, and helpful! Even though I only paid 20 bucks for the batteries, they're willing to stand behind their product and keep a customer.

How markedly different that is from the way Uniden has handled someone who purchased a 500 dollar radio, and another 100 bucks in accessories!

Remember, I mailed them the radio on the 5th, it was delivered on the 8th. It's taken THIS long to reach even this point for a radio that was absolutely fried and melted when they simply aren't even going to attempt to diagnose the problem or cause. To me, that's just pathetic customer service! It wasn't even entered into the system for 4 business days after delivery! It's not like they're chasing bugs, or diagnosing anything with this, which leads me to believe that they must be short staffed and swamped for it to have taken this long.

I will say that on my desk are a BC235, 245, 895, and a 780. I also have a Pro2067, 2041, Pro60, and Pro64.

I've never had any problems in the past with either GRE/RS or Uniden, but the one time that something DOES happen, well... It's enough to make sure I will NEVER trust their products again simply because of the way the have handled this whole matter.

Carbon-zinc, alkaline and lithium batteries are 1.5v, nickel metal hydride and nickel cadmium batteries are 1.25v.

It has to do with the chemistry, not the mah rating.

In any event, ANY of them are suitable for use in the radio.

From his descriptiom, it sounds like there was an internal short that caused the overheating. But that is all I am using is his description of what occured.

Obviously, I have no idea what actually occurred.

Unless I'm getting two threads mixed up (which I may be), he said he was
using 2700 mAH Powerex NiMH cells.

If that is the case, the position of the switch would not matter, as in
NiMH the cells would charge and in the ALK position they simply would
not charge.

Or am I mixing two threads?

And of course, Uniden has nothing to do but wait for your radio, and the moment it arrived, the should push aside all other work and concentrate on your radio alone.

Look at the sales figures and employee numbers for Uniden and your battery supplier. My guess is that Uniden is vastly larger and actually has more custimers than just you.

Fault.

Is it possible that anything in the BCD396XT circuit board could conduct enough current for a long enough time to produce the damage claimed? Doubtful in my mind. Sorry but I think the fault lies with the battery manufacturer, not Uniden.

Just check the CPSC site for how many thousands if not millions of computer battery packs have been recalled over the past 5 years. Every manufacturer has a resposibilty to report incidents if they may cause injury. It's not like Uniden didn't actually see the unit. Uniden is a reputable company that listens to it's customers.

I will also add that my channels are all programmed correctly - FM for FM channels and NFM for NFM channels. I can see how having a FM channel set to NFM mixed with a high volume level (higher than 10) might cause the audio amp or speaker to be overdriven. Some people actually promote doing this to get 'a little extra volume' out of the unit. I would *not* be one of those people.

I think you'll find reading here & other forums the speakers have a common problem of failing. I found mine failed then came back then failed permanently after it held out at 7 without failing (in the usual 10 minutes).

I've read virtually every message on this forum, and while I've seen maybe a dozen cases of speaker issues (small issue in the several thousands sold), I would hardly call it "something to be prepared to happen" any more than I would say "be prepared for lightning to strike your house" (which is probably more likely).

Nope. No clipping, no low audio, no distortion, no issues of any kind.
Again, I think the key is to have the channels programmed correctly.
This used to be a really huge problem when NFM systems started to become
popular. Several people were complaining about low audio when the
problem was that the channel was not programmed for NFM.

Also, if I'm in a more noisy environment, I will run the volume at or
near full. Still I have not had any speaker issues.

I've had mine for a year now. Scanning multiple agencies, some NFM and some FM. I have them programmed appropriately for each. I run my volume at 10 12 and sometimes 15 in my truck. No speaker issue here either.

6784. Red / blue flashing display

Hi all,

I tried (and failed) to upgrade my firmware tonight. I now have a red/blue flashing screen and the scanner will not do anything except flash. It doesn't communicate with the computer, and it will not reset using the hold/2/9 reset function. Modes anyone else know how to remedy this issue or should I throw the thing in the landfill?

Thanks

I see from rr.com that you've sucessfully completed the update.

For those who find this thread in an archive search, the answer is always "Restart the update, following every step." There is no way to permanently brick the scanner doing an update.

From: T
Topic: 6788 Message: 6788

In the past few weeks, I've been getting some ungodly squealing on my BCD296XT. It doesn't happen all the time, but when it does, it often over powers the transmissions. I've checked with a friend that has the same radio, and he hears it too. I don't hear it on my BC15 nor do I believe any of the PD, Fire and EMS units hear the squealing on their end.

The only thing I can isolate is the the noise only happens on Northampton County, PA freqs.

Anyone else get squealing?

For one unit, I would say it's low voltage on the batteries, but two doing it is odd - especially when other scanners are not doing it. What are the details? What frequency/mode/CTCSS(if any)/Etc.

Does turning the volume down affect it?

Turning the volume down only results in a lower volume squeal.

Pretty much any of the frequencies on this site, but mainly the PD freqs and some of the Fire and EMS freqs.

Only on a particular frequency? Sounds like something internal to
the scanner, like a birdie. I thought you could shuffle the IF
frequency on the 396 around a little to minimise these issues.

You can. It's called IF exchange (or IFX). (FUNC-4 on the XT)

6798. GROUP Quick Keys

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-07-08 21:19:41 UTC
From: n8wrl
Topic: 6798 Message: 6798

I am REALLY confused now.

I have several conventional systems each with a handful of groups.

To enable/disable a system, I can press the # of the system quick key while scanning. That works great.

While scanning a system, I see the groups I've defined on the 2nd line. Well, I *DID* before whatever happened, happened.

While scanning a system I tapped FUNC then the group quick keys I wanted to turn off. I must have turned them ALL off because now I don't see ANY listed for that system, and no combinations of FUNC and #'s restores them.

Worse, it started scanning built-in 'services' which I had to figure out how to lock out.

So, how do I re-enable groups within a conventional system? What did I do wrong?

F+Scroll to the conventional system. While "F" is still active (it will stay active for about 2 seconds after you stop scrolling) press the # for the GQK you want to enable.

I have noticed a quirk (maybe a bug), that does this very same thing. Try going through the menu and unlocking the group from the group setting menu. After that it seems to work fine using the previously mentioned technique.

The answer depends on why ARMER isn't being scanned. It could be:
* Enable the SQK assigned to the nearest ARMER site and disable the SQK assigned to the conventional system.
* Unlock the site and lock out the conventional system.
* Program the site correctly and delet the conventional system.
* Enable the GQK assigned to the channel group(s) in the ARMER system.
* Unlock the channel group(s) in the ARMER system.
* Program some channels into a channel group in the ARMER system.
* ...

I already have several channels programmed into the ARMER system. I can see them when I try to edit the system. But I can't get it to scan. What is SQK and GQK?

As I was writing this, I noticed that there were no frequencies stored under the sit name. Would that matter?

If there are no frequencies in the system, then the scanner will have no ability to scan or receive it. Matters tremendously.

SQK= System or Site Quick Key.
GQK=Group Quick Key

I entered some frequencies in the Conventional System and it is now scanning those. But I have several talkgroups stored under the P-25 system but it won't can those. It will only scan the Conventional System.

your conventional system and your trunk system need to be separate.

Is your trunk system locked out?

Do you have a quick key assigned to it?

Kristy,

Talkgroups are not frequencies. As UPMan said, you will need to enter the frequencies for the trunk system into the site.

Kristy, You should get a subscription to Radio Refferance first, then Download FREESCAN so you can program your system on the Computer. Third you need to buy or download the easy version of the Manual, and read, read, read, untill you understand how to enter your information and how to to program the differant types of systems. The 396XT is NOT a beginners scanner, and with the help of Radioreferance and the manual you will soon get the hang of it. Use Freescan to view differant typs of programs so you can see how they are programed. The cost of the Radio referance Membership is well worth the knowledge you will get from them not to mention the free programs. All you have to do is download and then uploAD TO YOUR SCANNER. Good Luck...

"Ask not of your friends , That which your friends could not ask of you."
God Bless....Ronald E Aubry

Topic: 6804 Message: 6815

I had a subscription to RR but it expired. That is how I programmed the scanner when I purchased it. I still have all the info saved on my computer as far as the talkgroup ID's. But my scanner just won't scan that system no matter what I do.

I even tried going through the Uniden manual and recreated a system with the ID's and it still won't scan.

Third you need to buy or download the easy version of the Manual, and read, read, read, untill you understand how to enter your information and how to to program the differant types of systems. The 396XT is NOT a beginners scanner, and with the help of Radioreferance and the manual you will soon get the hang of it. Use Freescan to view differant typs of programs so you can see how they are programed. The cost of the Radio referance Membership is well worth the knowledge you will get from them not to mention the free programs. All you have to do is download and then uploAD TO YOUR SCANNER. Good Luck...

As others have mentioned, the site frequencies are *required* in order
to scan a trunk system. You cannot scan it just with the TGIDs.

Assign that system a quick key of your choice.

You can assign that at the system level via the menu key.

Do the sites for your system have frequencies programmed into them?

On Jul 13, 2012, at 12:10 PM, Kristy wrote:

Gidday Ron,

You certainly hit the nail right on the head.

I think what you said should be put on our web page and also in the email when

they join as this would stop a lot of unnecessary emails.

These scanners require alot of effort and research to understand them and get them going.

Definitely not a beginners scanner !

Regards,

Doug VK2XLJ

Thank you everyone for your help today. I renewed my subscription to RR. I deleted all the systems I had on my scanner and started from scratch. So far it seems to be working. Haven't heard my local county yet but I'll give it some time. Thanks again!

Press FUNC key on left side of radio, then press the scroll knob down, it will click.
Now rotate the knob clockwise to increase squelch.

Hi, Just wanted to see if there was anyone that could answer my question. I heard not to charge the batteries in the scanner itself. I was wondering if anybody was able to find a charger that would ony charge three batteries at a time. I have a battery charger but have to charge two or four at a time it will not let me charge just three. Just wanted to see if anybody had any ideas?

The La Cross BC-900 will charge 1, 2, 3 or 4 batteries at once, also has a conditioning mode.

Just to add, the MAHA C401FS will charge each battery individually. Sanyo Eneloop Slow Discharge are good recommended rechargables.

I have the Maha Powerex MH-C401FS

Charges 1-4 four batteries independently. It is a smart charger, with selectable slow or fast charge rates.
I use the slow 5 hr setting as to not heat up, and age the batteries.

I'm super happy with this charger, and Powerex's product line, including their 2700ma AA batteries.
Which I use for the 396XT.

Great product...

It's kinda funny because the primary reason behind not charging the
cells in the scanner exists in any charger that cannot charge the cells
individually. I use the MAHA MH-C9000, but I used to use the 401FS and
it will do the job, too.

Specifically, when you charge NiMH cells, smart chargers will be able to detect when the cell is full and reduce the current to the cell.

When you have multiple cells in series, this detection may not occur, and even if it would and the scanner could detect it, that would only mean one of the cells is fully charged.

This is not just an issue with Uniden scanners - all scanners use cells in series, so the issue exists with all of them.

You can charge cells in the scanner, and it will work. That is why they have that ability. The point is that it is more safe, and better for the cells, to charge them individually in a charger that can charge them properly.

There have been cases when cells have shorted when on charge. This results in catastrophic results such as melted cases and of course destroyed cells. I've heard of this happening more often with other brands than with Uniden, but it is still possible. If a cell shorts, would you rather risk a charger ($10-50) or a $500 scanner? I actually had a cell short in a charger (I have pics of it on one of the scanner lists), and due to the fact that it was much more open to the air the heat release did not damage the charger. Had this cell been in a scanner I'm quite sure the outcome would have been different.

There is also the issue that I never have my scanner tethered to the wall. It is always available for use 24/7/365. I have several sets of cells I use, so it does not matter if one set is at home on charge.

For the ones that use smart chargers, what rate do you charge at assuming the batterys are 2400mah? I have a bc-900 and was wondering.

> Better to be safe than sorry.

It's $49.95 or less at other places, such as:

http://www.mahaenergy.com/store/viewItem.asp?idProduct=178

$59.95 seems kinda high.

6835. Startup Keys

6836. P25 Site advice

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-07-25 03:39:56 UTC
From: David Johnson
Topic: 6836 Message: 6836

I am in New South Wales Australia. We have a P25 Government Radio Network that tries to cover the whole state (800,642 square kilometres, or 319,129 square miles). To do this there are about 162 base stations, all linked together.

Am I better off putting all of the control frequencies into one site, or is it better to have a separate site for each base station, putting the control channel and alternate in?

Thanks.

You have an XT scanner which is optimized just for the type
of System you have. Put each site in as a separate Site.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-07-25 04:17:49 UTC
From: David Johnson
Topic: 6836 Message: 6838

Thanks. Would this make the scanner more likely to pick up Talk Groups? With all the control channels as one site, it tends to lock onto one frequency and misses conversations on nearby base stations.

Yes, for the reason you mentioned. If there are TGs active on other
sites that are not active on the one you are monitoring with them all in
one site, it will pick up those ones, too.

1. The latest firmware is always at http://info.uniden.com/UnidenMan4/BCD396XTFirmwareUpdate. Not knowing what version is in your scanner, I cannot definitively answer your question.
2. Depends on what you are doing that isn't working. There is a pretty good article in the RadioReference.com wiki. You might try reading up on it, there.
3. Not sure what you mean by the "right center frequency."

6847. Band Defaults...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-07-28 18:31:39 UTC
From: Lance
Topic: 6847 Message: 6847

Has anybody changed the default tuning step size for the VHF band on your 396XT?

Specifically, from 12.5khz down to 6.25khz in the 162.00-174.00 segment?

I asked as I was reflecting on some freqs. found last year during a major brush fire that utilized the 6.25khz allocation.

Also, some of the newer CDF(California Dept. Forestry) freqs. in the 151mhz region also use 6.25khz allocation.

I welcome your comments...

That appears to only work if you were in Scan mode and it had stopped on a frequency or talk group. If you were on Hold and wanted to resume scanning the scroll knob just goes to the next frequency or talk group.

But, if you were in HOLD mode, pressing
the lockout key could be easily undone.

When you said "to resume scanning",
I took that as you were in scan mode.

just do it the way i do it.
I'm blind. I use my fingers to see where the buttons are.
Maybe its a good idea to just feel around and get the idea position of the buttons on the scanner.
So you can use it if there isn't a way to look at it.
Just a suggestion.

Thanks to all for your suggestions. My suggestion to Uniden for future consideration still stands.

In a message dated 8/14/2012 11:14:22 A.M. Pacific Daylight Time, maderradionetwork@... writes:

just do it the way i do it.
I'm blind. I use my fingers to see where the buttons are.
Maybe its a good idea to just feel around and get the idea position of the buttons on the scanner.
So you can use it if there isn't a way to look at it.
Just a suggestion.
Jerry Mader

That appears to only work if you were in Scan mode and it had stopped on a frequency or talk group. If you were on Hold and wanted to resume scanning the scroll knob just goes to the next frequency or talk group.

Just slightly modify your operating practices.
Use the scroll button to resume scanning.

6856. DC Adapter...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-08-19 17:41:20 UTC
From: Lance
Topic: 6856 Message: 6856

Greetings,

I'm needing to purchase a DC adapter for the 396XT.

I've seen different ones on ebay, like the adapters with the green background in the photo. However, I'm skeptical, and would like to know what is legitimate as a after market product.

Thank You.

-Lance

Well that's the thing about 'aftermarket'. It would be hard to call any aftermarket product legitimate, at least in the eyes of the original maufacturer. They would quote you chapter and verse 'not supported', not recommended' etc. etc.

If I needed one I would go ahead and buy it, then check the voltage output, open circuit and under load. If it produces what you want, rock on!!

If you are going to spend four or five hundred dollars on a high-end scanner, why would you risk it not buying OEM on something like an adapter. Is the extra 5 bucks going to make a difference to the year-end bottom line?

6861. Trouble with P25 adjustments and squelch

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-08-25 03:34:41 UTC
From: Alex
Topic: 6861 Message: 6861

I'm still having some difficulty with the P25 adjustments trying to fine tune the reception.

First, since it's a global adjustment rather than a system-by-system or group-by-group adjustment, I don't have too much leeway in the settings before I knock out one system while trying to get another one improved.

Second, no matter what I change, the P25 diagnostic data (F-Vol after showing volume or squelch) doesn't show anything indicating my changes are taking effect. For example, if I adjust the mode from 8 to 10, the diagnostic screen still shows '8 AUTO'.

In any event, I'm still having trouble with some signals breaking up. Most of the time it's a decoding issue since you can hear the "robot" audio as the decoding fails. Occasionally it's the squelch which is a second issue.

So regarding the P25 adjustments, any recommendations for tweaking the settings that might clear up the breakup issues without ruining other systems? Perhaps that should be a suggestion to Uniden for updated firmware which makes the P25 adjustments available on a system basis instead of a global one.

The second issue is the squelch. It seems that my squelch has an optimum point somewhere between 1 and 2. If I set it to 1, it opens up frequently on most frequencies (especially analog without squelch tones). If I set it to 2, I lose some transmissions that are just barely below the squelch limit. I would think that the squelch processor having an adjustment range of 0-15 should have been set up to have a nominal squelch setting at say 7 instead of 1 or 2. Leaves much more room for fine adjustment.

I'd appreciate any suggestions to get around the squelch issue, too.
Perhaps that's another Uniden suggestion for the next firmware revision. :)

From: dataman60435
Topic: 6861 Message: 6862

My squelch is set at "2" all the time as i had the same problem at "1" u did....As for the Decode levels it should be per "tower" as i see a difference in each digital tower site and 7-8 works on some and if i raise the #'s from 3-50= 7-8 to 15-100 = 10-15 on the decode then i get bad results and err: 50-75....I think its a real judgement call....

You can use any GPS that has a NMEA interface.
I use some from Deluo and Byonics. They are
essentially the same thing as the Uniden model.

I use a vintage Garmin GPS-III that are commonly available for chump change at hamfests and eBay. Anything that can output NMEA data to a serial port will work, stay away from USB Only devices, which are what most of the current Garmin, TomTom and other devices are.

From: Upman
Topic: 6863 Message: 6868

The standard for communicating GPS coordinates between devices is NMEA0183, which specifies a serial link at 4800 BPS. Unfortunately, there are several problems with USB interface GPS devices:

1) For the most part, they do not output location data at all, even out the USB interface.

2) For a USB client device to communicate with a USB host device, the host device must load drivers specific to the client device. There is no way to load drivers on a scanner.

Note, however, that several Garmin models with USB can output NMEA0183 format data through the use of a special cable. Argent Data (argentdata.com) sells such cables for around $50.

The older Garmin cables are still available in places here and there.
I saw them at Bass Pro Shop the other day. (These cables have the
keyed round 4-pin connector for the GPS to tinned ends.)

You may need to wire them to a DB9 to match the serial port on the scanner.

The cable I have has "Garmin" molded into the one end. I checked my Amazon history and did not see that I ordered it there so I must have ordered directly from Garmin.

It has the unique flat connector to the eTrex at one end and a 9 pin serial connector at the other. I ran the serial connector into a null modem and that into the serial connect of the Uniden cable.

There is a YouTube video showing the set up. That's is what suggested it to me.

I had to change the comm setting on the Etrex from Garmin to NMEA 4800 and 4800 baud on the Uniden.

That cable won't help with connecting a GPS.

Hi guys,

I think we've heard enough on GPS's to last a lifetime. I didn't think you could use one with a 396T so what is the relevance here? Fortunately, I can read a map, when really necessary so I never needed one.

I saw the use and need when I had a sailboat, but I never thought people in card would use them, let alone with scanners.

What did people do before them, just stay permanently lost?

Ray

The older Garmin cables are still available in places here and there.
I saw them at Bass Pro Shop the other day. (These cables have the
keyed round 4-pin connector for the GPS to tinned ends.)

You may need to wire them to a DB9 to match the serial port on the scanner.

The cable I have has "Garmin" molded into the one end. I checked my Amazon
history and did not see that I ordered it there so I must have ordered
directly from Garmin.

It has the unique flat connector to the eTrex at one end and a 9 pin serial connector at the other. I ran the serial connector into a null modem and that into the serial connect of the Uniden cable.

There is a YouTube video showing the set up. That's is what suggested it to me.

I had to change the comm setting on the Etrex from Garmin to NMEA 4800 and 4800 baud on the Uniden.

6876. Re: [BCD396XT] Enough already

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-08-30 15:02:20 UTC
From: Paul Opitz
Topic: 4199 Message: 6876

You can connect a GPS to the BCD396XT...it is quite relevant to the list. GPS for scanners has nothing to do with navigation, though. It is all about more safely and conveniently using your scanner while mobile. The GPS provides your precise location to the scanner. The scanner can then automatically lock and unlock sites and channel groups as you enter and exit their ranges, so you don't have to take your attention away from driving to hit the keypad to turn stuff on and off manually. By locking out stuff when you are exiting jurisdictions, you can limit receptio to just those comms that are relevant to where you are at the moment.

The older Garmin cables are still available in places here and there.
I saw them at Bass Pro Shop the other day. (These cables have the
keyed round 4-pin connector for the GPS to tinned ends.)

You may need to wire them to a DB9 to match the serial port on the scanner.

The cable I have has "Garmin" molded into the one end. I checked my Amazon history and did not see that I ordered it there so I must have ordered directly from Garmin.

It has the unique flat connector to the eTrex at one end and a 9 pin serial connector at the other. I ran the serial connector into a null modem and that into the serial connect of the Uniden cable.

There is a YouTube video showing the set up. That's is what suggested it to me.

I had to change the comm setting on the Etrex from Garmin to NMEA 4800 and 4800 baud on the Uniden.

Hi! I have a brand new serial cable. It's the serial to USB 1. If your interested let me know.

Tom

6877. Re: [BCD396XT] Enough already

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-08-30 15:06:10 UTC
From: V. Singh
Topic: 4199 Message: 6877

I drive 220 miles per day to and from work and usually many more on the weekends. I love the GPS feature. I don't have to take my eyes (and hands) away to fiddle with the scanner. The ability to "automatically" turn on and off groups is very very useful.

*Regards,
V. Singh

From: mike
Topic: 4199 Message: 6878

I too spend a lot of time on the road over a wide geographical area and the GPS feature is great for this. I’m using the Uniden GPS and I think it’s performance is adequate but It seems to have a few quirks. First, it seems to have a location tolerance of plus or minus 2 or 3 miles. In other words lock/unlock can occur anywhere from 2 or 3 mile outside to 2 or 3 miles inside the radius I have programmed. Also, the locks/unlocks seem to occur in spurts rather that in real time as I pass from range to range as programmed … it’s almost as if the GPS is only checking its location every 10 minutes or so. Can anyone comment on the performance of non-Uniden GPS units?
Mike

I must look into this feature. It would be perfect for monitoring
our fire service (which is what I do with my 396XT 99% of the time),
which extends across the state. Driving with the GPS helping select
the most appropriate channel would beat simply scanning all of them.

From: T
Topic: 6856 Message: 6881

Im sorry- That is not an OEM DC adapter. That is made by the same company that makes a tone of the aftermarket cell phone adapters. I know, Ive been in the business since 1999. The cost to the retailer $1.93. That being said. Even the ones that say "Uniden" on them and are sold by Uniden could be made by the same company. They just use heavier duty parts and wires.

That's why this is a forum. Everyone can chime in. This is the 396XT forum which can use a gps. IT's that new contraption with the light up maps... Can a map read out the turns for you so you can keep your eyes on the road? Does it look it up by business name, or from the sound of your voice? Does it cover the entire country in one small package? That's why they are a billion dollar industry..In more cars than I guess you've noticed. Welcome to 2002.. Just funin with ya.. hey did you hear about them phones with no cords??? That you can take anywhere with you what a waste.. bet they do about as well as those silly home computers..who'd want one?

. :) haha HAppy Friday all

sent from my iPhone which is why everything is spelled correctly. Thankfully it can't auto correct sarcasm. Yet.

6883. Re: [BCD396XT] Enough already

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-08-31 13:57:05 UTC
From: Paul Opitz
Topic: 4199 Message: 6883

Location is precise. However, if you have a ton of stuff set for GPS control, you should note that GPS checking is secondary to actually scanning. This can cause latency like what you are seeing. If you are truly far away from some of the areas and not likely to be driving into/out of their ranges, you could disable their SQKs so that the location check algorthm will ignore those systems. For an example, while have Dallas geotagged in my scanner, I seldom drive over there, so I leave the systems over there disabled. My latency for just Tarrant County is near 0 (that is, systems turn on / off at nearly the precisely same location every day).

Subject: Re: [BCD396XT] Enough already

I too spend a lot of time on the road over a wide geographical area and the GPS feature is great for this. I’m using the Uniden GPS and I think it’s performance is adequate but It seems to have a few quirks. First, it seems to have a location tolerance of plus or minus 2 or 3 miles. In other words lock/unlock can occur anywhere from 2 or 3 mile outside to 2 or 3 miles inside the radius I have programmed. Also, the locks/unlocks seem to occur in spurts rather that in real time as I pass from range to range as programmed … it’s almost as if the GPS is only checking its location every 10 minutes or so. Can anyone comment on the performance of non-Uniden GPS units?
Mike

6884. system quick keys

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-08-31 22:39:09 UTC
From: Jeffreyinberthoud
Topic: 6884 Message: 6884

I appoligize sure ists been asked before I have had my 396XT since day 1 and have always programmed with the ARC XT program love the set up
and quick keys when it come to priogramming data and keeping things in order.....HOWEVER

How the heck do I use the quick keys for system turn on turn off
when I am mobile ? I have no clue and can not find this data anywere

6885. Re: [BCD396XT] system quick keys

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-09-01 03:18:18 UTC
From: Paul Opitz
Topic: 6884 Message: 6885

I guess I don't understand the question. Mobile/fixed location doesn't affect how quick keys work.

Paul,

I think what he means is setting quick keys when he is out and about (mobile) without his computer nearby to program it via ARC XT software.

For single-digit SQKs, just press the number on the keypad. For
double-digit SQKs, hit the decimal point then the two-digit SQK.

Hi all,

I may have been mistaken, I thought I saw discussion of the GPS on the 396T, which I don't think uses GPS Technology. Although, I will admit I thought only the Home Patrol used that technology.

It's just too bad subjects have to beaten to death here, okay we discussed GPS can we move on? No one ever updates their subject lines so you can't follow anything.

Right now, I have cleaned out everything from the list, except this post. It will be interesting to see how this appears when the next list is posted.

Are things like this: the arrows a necessary part of posts or can they they eliminated

When you power up and hold a quick key 0-9 and have a specific quick key on a system, "proccessing quick key 1" so I put quick key 1 on a system and locked it out, then power off did quick key 1 (hold down while powerup) it did not unlock the system I put on quick key 1. Same for quick key 2.
I thought it meant it would scan only systems with quick key 1.
I use the quick keys alot, for going in and out of adjacent states, have not been using GPS (need a splitter/gender bender connector.) as I sometimes use a laptop for GPS nav, I almost always have a gps running in the car.
I added location and it did not change the state of locked out or unlocked for the quick key.

Another mystery: What is the difference between Priority and Priority plus?

You're confusing StartUp Keys (what you use at power-up) with System
Quick Keys (what you use with the scanner running).

Hi,

I have been given a Proscan text file.
Is there a way to convert it to a file suitable for import
to Free scan?
Thanks for any assistance.
regards
Alan

You should be able to open it up, copy the data, then
import it into FreeScan using the EZ-Grab! function.

You may have to import the data into Excel to get it into separate cells.

You'd need proscan to load it into your radio.

The radio only understands ONE set of commands. The various pieces of software save the information in daya files that are typicaly unique to that specific software. Thus software reads it's data file, converts it into that one set of commands that are sent to the radio telling the radio to setup a system.

Thus, in almost all cases, you must use the software that created the file to upload (program) to the radio

What about startup keys, how are these best used?
Holding 1 on power up for example, and having "startup key" set in a couple of systems, does not seem to change locked out systems,
unless they are above the first 10 quick keys.
Say I get a chase going, and I want only 2 systems going in the scanner, startup key doesnt really do that, and priority seems to disable the effect it does have.
Also what is priority plus vs plus?

They could be eliminated, but why? It doesn't hurt anyone or anything. Just because you are tired of a certain topic is no reason whatsoever to stop the topic, even if only two others wish to continue it, provided the discussion stays relevant to those interested in the topic.

Is people complaining about other people's posts a necessary part the group or can it be eliminated?

For what you want, the System Quick Keys are the ticket.

Just set the SQK for each conventional System (or Site in the case of
trunked Systems) to a SQK (say number 1), and you will be able to
instantly enable/disable everything by pressing the 1 button when you
are scanning.

I would disable any StartUp Key you have assigned so it does not
compound what you are trying to do.

Jeffrey,
Am I correct in thinking that you have programmed some Systems with System Quick Keys (SQK) and Group Quick Keys
(GQK) but then don't know how to use them ?
Using Quick Keys is not the same as locking or unlocking Systems.
With Quick Keys, you activate or de-activate a system. Muck more flexible.

During scanning, you can enable or disable single digit SQKs by pressing the corresponding [1 - 9, 0] key.
For two-digit SQK's first press (period) [. / no / pri], then enter the two digits to enable or disable that SQK.

For GQK s, during scanning, press the Function (on the left side) and then quickly press the assigned GQK.

Hello,

I have a minty BCD 396XT for swap or sale, it comes with the programming cable.

I would swap it for an AOR AR 7030+ receiver, adjusting the price difference

If somebody is interested, please mail me off list.

Thank you.

Hey Clark,

I wouldn't look at it as being wrong so much as being skeptical because it seems almost too good to be true.

I can tell you I WAS skeptical until I tried it with my BCD396XT and I could not believe it would ever work so well. It worked so well in fact I nearly wore out the data cable connector trying to use it on my belt with a Garmin 60csx on one side and the scanner on the other. You see I live in a state where scanners are outlawed and though hams are exempted the way the law is written they can confiscate the scanner, destroy it on the spot and then ask me for my ID. I also travel to a city weekly that has a similar ban.

The best way to learn is to ask so hook up that GPS and have a go at. You'll be impressed. Just review UPMan's comments on this thread to keep things in perspective and you just may be amazed too.

Kentucky outlaws scanners? Wow, good thing I have no need to go to Kentucky. So I'll add Kentucky to the list (same as New York, don't need to go there).

Yep. Some states are ridiculous that way. Add Florida, too. You cannot transport a scanner in Florida or use one in a public place. Technically, you cannot even have one delivered by UPS or FedEx according to how the law is written. Of course, in those cases the delivery company is in violation, not you.

If there is an exemption for hams in KY, they should not be able to confiscate the scanner if confiscation is allowed by the law. An exemption is an exemption - period.

Google is your friend!

http://www.afn.org/~afn09444/scanlaws/

Note: Scanner aps on phones may (and probably are) illegal in states that ban use of scanners in motor vehicles

The FCC has granted a federal exemption to amateur radio operators for the use of AMATEUR RADIO units that can receive outside the ham bands. Scanners are generally not covered by this exemption.

In any case, "low profile" is also your friend!

Well I can't add Florida since I live there. :)

But Florida's law is vehicle only and not scanner possession in general (such as carrying it around, fortunately) and there's no confiscation, only a fine. Public use in Florida is ok as far as I've been able to understand since the law only makes mention of vehicles. I've used mine in public frequently with no problems. More specifically, the scanner had to be connected to the vehicle as determined and clarified by the Florida Attorney General. A handheld sitting on the seat not attached to the vehicle in any way does not violate the law. That clarification eliminates the issue of USPS/UPS/FedEx being liable and also allows people to transport a scanner to events or locations(Daytona 500, the beach, etc.) where it can again be used on a person.

From the description for KY it seems that simply having one period was just out of the question or watch it get smashed to pieces. New York makes it restrictive to have just about anything that can receive other than a regular TV or commercial 88-108 FM radio but then again New York is just restrictive on everything.

I was slightly incorrect. The law does not specify "public places" - it specifies "business establishment" (easy to confuse, as most businesses are open to the public).

There is an opinion of the FL Attorney General that portable scanners are not included in the definition of "installed", but the law also excludes the transportation of scanners in vehicles, so there is a conflict there.

In short, the law says "A person, firm, or corporation may not install or transport in any motor vehicle or business establishment"... (anything that can receive police or fire frequencies).

So, while you can use your scanner in a public place, you have to walk there, I guess, as the law precludes transportation in a vehicle. And you can't go into any businesses. For all practical purposes, they made scanners illegal except in your own home.

Now, are there people who are going to install and transport scanners anyway? Of course. It's just a matter of how much risk you want to accept. As I said before, even UPS and FedEx break the law when transporting scanners for delivery.

Somehow this thread no longer has anything to do with the Subject Header
which I admitted was wrong information.
Now the thread has been hijacked as to the legality of scanners in vehicles.
It's really not that difficult to change the Subject.

Florida is one of the most paranoid States in the Country. They have tried to outlaw scanners for years. They encrypt everything (SLERS). What is it that they are trying to hide? They need to change their nickname from "The Sunshine State" as far as scanners go there is no sunshine and no openness. The State Officials are a bunch of morons, but wait..... this is the State that spent weeks looking at chads and dimples on voter cards....... never mind.

@Clark,

I think it's relevant for all of us, and especially considering the investment...

Nice to know we are looking out for each other as a community of scanner owners...

From: Gail Wisher
Topic: 6900 Message: 6923

Since Oakland moved the problem AT and T and I reloaded the latest changes from Radio Ref my reception on this p25 increased . It alsmost sounds like the old system. The 396 XT is following digital and non digital as I also listen to local PD (Alameda) as they have not made the switch yet. It also is following some handheld to handeld chatter and Dispatch to handheld and especially during street chases.. For a while there I was ready to junk this unit .

I have a problem with the com port availability. My com port is 7 @9600 (via a serial to USB converter the upgrade only goes to 4 and the speed does not go that low.
Any help would be most welcome
Thanks
Pom

Pom -
Try assigning another number to the com port in Windows Device Manager (System, Hardware, Device Manager). One of the options when viewing the properties of a virtual port is to assign it another comm #; since you don't have 4 physical ports, you could assign it to port #4 and it should work. I don't think it will require a reboot, but it might. I haven't done it for a long time!
At the same time you should be able to assign a port speed; but with the a port number the software can recognize, that might not be a problem.
Good luck!
Robert

You can manually assign the COM port under Windows.

So, any COM port can be any COM port number.

I moved the Com port to 1 and the rate to 57800 and made
sure every thing was communicating (Proscan communicates OK)
I follow the instruction to the letter and now get the
following error message "This scanner is not an object for
BCD 396XT rewriting impossible" I do have a 396XT serial #
359A 28000954
any ideas?
Thanks
Pom

Two things come to mind.

First, some people have reported issues using USB
adapters for the update. That may be the issue.
Try using a real serial port if you can.

Second, make sure you are using an extracted (non-zipped) file.
Don't use one that is zipped or compressed.

1.10.00 is the latest.

You can get it by simply typing "BCD396XT firmware" into Google and the
Uniden web page is the first link. It has very explicit directions on
how to get the update.

From: Paul Opitz
Topic: 6314 Message: 6933

Based on the error message (and thank you for providing a complete error message), you have a UBCD396XT (Australia version). You cannot apply the firmware update to that model.

From: alan <alexwagga@...>

Subject: Re: [BCD396XT] Re: Firmware Update Released

I moved the Com port to 1 and the rate to 57800 and made
sure every thing was communicating (Proscan communicates OK)
I follow the instruction to the letter and now get the
following error message "This scanner is not an object for
BCD 396XT rewriting impossible" I do have a 396XT serial #
359A 28000954
any ideas?
Thanks
Pom

Jerry,
The latest version is 1.10.00 and is not exactly new. It has been available
for at least 6 or 7 months.

6937. P25 Decode Adjustments - Followup

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-09-21 02:45:57 UTC
From: Alex
Topic: 6937 Message: 6937

This is a follow up from a previous post. I tweaked the P25 decode settings a bit more and for the most part things seem to be working. However, I am having trouble while in motion. It's probably picket fencing but I get a lot more dropped signals and decode errors when in motion (even slowly) compared to standing still. Some of the trunked systems that I listen to come in fine at first and when I start moving I lose them.

I'm using an external antenna most of the time so I should be able to pick up signals pretty well. I'm also well within the footprint of most of the towers. I'm at a bit of a loss for what left to adjust to try and bring in the signals all the time.

Any additional suggestions?

6939. "Nothing to Scan" - I think it's a software bug

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-09-21 05:49:34 UTC
From: Steve Wilson
Topic: 6939 Message: 6939

Yes...this seems to be a frequently asked question, but I have yet to find a definitive answer. Frankly...I feel it is a defect in the software. I can use the Func + # combination to turn on and off groups within a system. But once you you turn off all groups and get the "Nothing to Scan" message, the Func + # doesn't work to turn them back on! Logically, doesn't it make sense that it should work ALL the time, not just some of the time? I've seen some posts with directions to use the Func and the knob, but that doesn't seem to work. As another poster mentioned, the only thing that seems to work is to plug in the software cable and reload.

I've seen similar posts, but the answers are the usual blah blah blah about how the scanner works and how to turn on and off systems and/or groups.

The one pattern that I am seeing is this seems to be an issue with conventional systems and not trunked systems.

Again...this seems to be a software bug. Can someone confirm? There was no change between the last firmware version and 1.10.

Thanks, Steve

Make sure your squelch is fairly low. I always use a setting of '2'.

It's not a bug. The scanner did what you told it to do.

You have to understand that once you turn off everything on a System, the scanner starts scanning the next one in line. If there is no 'next one', then it gives the error of 'nothing to scan'. So, you decide to 'turn a group back on'. The scanner is supposed to decide which System you want the group turned on for? I have hundreds of Systems. You could argue that you want it turned on for the last active system, but then it's really not logical that you want to turn on something you just turned off.

I try to remember to enable *before* disabling, hence avoiding the issue entirely. If I'm disabling an entire System, I use the SQK, not a GQK.

That said, the FUNC-Scroll with FUNC-# method works fine - all the time. You just have to be in HOLD mode when you use it (hit the HOLD button if you were not in that mode previously). I've used that method many times.

Another workaround is that you could simply add a group with an unused conventional frequency (or TG for trunked Systems) and assign that *no* GQK and leave it unlocked. That way, it will be impossible to disable a System by disabling all the groups. After all, that IS the issue - a user disabling all Groups in a System.

The above are pretty much the definitive answers. You may not like them, or call them "blah blah blah", but all three methods work fine. I use the first one (enable before disabling) with the second as a backup. I've never found any need to go to the third method.

One man's bug is another's operator error. To me, the bug would be scanning a System that has everything disabled.

MODERATOR'S NOTE: While the below works for now, the correct answer is always to check the official update page at the link provided earlier (and repeated here: http://info.uniden.com/UnidenMan4/BCD396XTFirmwareUpdate).

Sending this as well as a BCC to your home email address.
Here is the link to download from the 296xt yahoo group file section.
http://groups.yahoo.com/group/BCD396XT/files/Firmware/

If it doesn't work go to
http://groups.yahoo.com/group/BCD396XT/?yguid=17137243
then click FILES in the upper left, next Click FIRMWARE folder.
You'll need the two .zip files for sure.
First one (uploaded by me btw) is the the program that performs the update and the other is the actual firmware.
I strongly believe you will need to enlist the help of another to help you on this Jerry.

Also one final setting change from upman when they released the firmware:

set the decoding threshold

While holding down the HOLD button, power on the scanner.

> Access the hidden P25 Adjust Mode menu by
MENU --> Settings -->P25 Adjust Mode. Set the mode to 11,
which is the optimal setting for most P25 systems.

> If you have previously adjusted the P25 Adjust Level, reset it to a

6946. Re: "Nothing to Scan" - I think it's a software bug

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-09-22 00:23:35 UTC
From: Steve Wilson
Topic: 6939 Message: 6946

Thanks, for your reply, Joe. The one component to my scenario that I failed to mention, is that I had only one system active at the time. So, in this scenario, it would be "nice" for the scanner to "assume" that you want to activate the group for the currently active system. Now...that said...I totally get the fact that that is an isolated scenario and it would make sense to have a way to address the other 90% of the time when you have more than one system active, as is the current state. :-)

So...I sat down with a fresh perspective and found that what was not working was, as you listed, Func-Scroll and Func-#, which I interpreted as two presses of Func...once with scroll and once with the number. But the 2nd press of Func obviously cancels the function if active. So my interpretation may be incorrect, but that is how I viewed it. What DID work was pressing Func once, scrolling to the desired system, and then pressing the desired QK for the group.

So...I accept that it was userware error on my part, but I think a clearer description of the process, IMHO, would be: Func-Scroll-#.

Thanks, Steve

P.S. Hope that those who were able to watch the Shuttle Endeavour/SCA flyby got a good view. The view from Moffett field was outstanding!

Topic: 6939 Message: 6947

All in all, I would prefer the option that the scanner would not allow you to disable the last remaining scannable items. So, if you tried to disable a SQK or GQK that would result in "nothing to scan", it would instead give you the error message rather than disable it and let you know there is nothing left.

You are completely correct on the FUNC button operation. If you press FUNC-Scroll, you have a time where you don't have to press the FUNC key before pressing the GQK. But, if it times out, you would have to press it again. Just remember - you have to start in HOLD mode. If you're already in HOLD mode, you can skip that button press, too.

Maybe think of the FUNC-SCROLL FUNC-GQK as being in function mode, not necessarily pressing the FUNC button. But, I can certainly see where there could be some confusion.

From: Alex
Topic: 6937 Message: 6948

I never change the squelch setting, it's always 2 because 3 or more pretty much silence the radio while 1 or less makes it open up on any little blip. I think the squelch range is a bit too compressed. It really should have the 0-3 range expanded to fill 0-15.

Yes but it's not likely multipath because the problem happens even if I'm out in the open (say a very large field). There isn't anything to bounce extra signals from. It also goes away the moment I stop no matter where I am. Multipath failures depend on physical location more than velocity. If I'm in an urban canyon, there are going to be spots where reception just doesn't work because of multipath even if I'm standing still.

6950. Scan range limits

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-09-23 18:16:52 UTC
From: glg-swl7687@comcast.net
Topic: 6950 Message: 6950

Hi Group,

I would like to setup a scan range limit in my 396xt, like 250Mhz to 360Mhz as an example. Only scanning between 250Mhz and 360Mhz.

How does one complete this? How do I load in the mode I want to use, WFn as an example?

Thanks for your comments.

Greg

Greg,

You will need to go into the menu and scroll down into the search menu.
Scroll down to edit custom search. From there you can set up a new search range, including lower and upper limit, step size, and mode. You can even name it if you want.

Hope this helps and you find something really interesting...

Set up a 'Custom Search' using the following menu selections:

Menu button
Search For...
Edit Custom
(select one of the 10 search slots)

From there, you can edit the name, range, and all the other options.

When you are done, us the following:
Menu button
Search For...
Custom Search

and make sure you only have the slot you set up selected using the
keypad. Press the numbers to enable/disable slots.

6953. out of space already?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-09-25 05:35:57 UTC
From: gteague
Topic: 6953 Message: 6953

so i got my 396xt in today to replace an old and worn out 396t. from the specs, the 396xt should have 3-4 times the memory of the 396t, so i was unconcerned as i imported some systems from radiorefdb using arc_xt (i think--i'm trying out 3-4 different software pkgs), but i was putting in only my 4th or 5th trunk system when i got a message that i was out of space for talkgroups. i had at least 7 trunk systems in my 396t along with a bunch of conventional freqs.

now i admit i haven't had time to go through all my reading for this scanner yet--i'm doing that right now. but until i can find out the answer, can anyone tell me what sort of limit i likely ran into? sorry, i can't remember the exact systems i was importing nor which one put me over the limit, but i do know the first three were tarrant county (tx), ne tarrant county, and arlington. i had also put in some misc conventional such as frs/gmrs/murs, but they shouldn't count against my talkgroups, right?

and i admit that even though i used the 396t for years, i never thoroughly understood trunking other than talkgroups shared a pool of frequencies over a control channel. arc and other software combined with radio ref db makes it very easy to import such systems without knowing the exact plumbing of them.

thanks,

/guy (73 de kg5vt)

I had this problem too. You're limited to 500 talkgroups per system.

When you reprogram, make sure you are overwriting systems with the same name. I was creating a ton of duplicates on mine. Just something to check.

From: gteague
Topic: 6953 Message: 6956

thanks for the tips guys. i knew the radio came preprogrammed with over two dozen systems and i shouldn't have run out with only four local systems that i had installed on my previous 396t without problems. so now i am adding one system at a time to try to determine where the problem was and mostly sticking to arc_xt since i'm most familiar with that application.

i got distracted trying to bring my 396t up to date on firmware since it had v1.xxx and the current version was 3.xxxxx. i'm not unfamiliar with such processes, yet it turned out to be over two hours of frustration trying to find ser/esn numbers, register, and find links. god help the average consumer who buys one of these radios and tries this!

and as to the new 396xt, the uniden manual/wiki is so slow it's near to being useless. right now i'm working off the radioref wiki for the 396xt and the 'easier-to-read' manual i found online. any other sources of documentation would be greatly appreciated if any of you guys know any. even though i've previous used a uniden model, it's like i'm starting all over again and i have a million questions i could ask, but i'll put in at least another week's reading before i hit you folks up. i did order a printed manual from scannermaster, but i think it's the easy-to-read manual printed and that manual is indeed easier to read, but the undeniable fact is that the 396xt (along with the yaesu vx-nn series) are nearly unlearnable for all aspects of operation in their complexity.

thanks!

I doubt this is the issue, but make sure you delete the preprogrammed
systems that come in the scanner. That could be the problem.

I have this problem too. There are well over 500 talk groups on the
NSW GRN. I need to select which ones benefit from alpha tags and which
ones are just TGID numbers. Annoyingly, this also means I can't use ID
SCAN for some users, and I need to resort to ID SEARCH, such as
Sutherland Shire Council.

thanks joe. yeah, i zapped those factory-supplied systems when i found out i could get them back with the reset sequence, but just in case, i stored the out-of-the-box state of the radio (systems and config) into arc_xt and freescan files. unless i'm doing just a small change, i usually tell arc_xt to delete all current systems on the radio before writing the new ones from the computer although i'm sure as i get more than a couple dozen systems and my conventional scanning groups that blanket delete will become unwieldy and i'll have to become more selective.

6961. new feature startup quickkeys behavior?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-09-25 21:15:03 UTC
From: gteague
Topic: 6961 Message: 6961

in transitioning from the 396t to the 396xt, one of the new features is startup keys. and i tried it out my first day with the radio since i figured it was a natural for my use. i live in fort worth and work in arlington, so i figured that if i was going to work or coming home from work i'd startup with the arlington quick key, otherwise i'd startup with the ftw quick key.

but i ran into immediate problems with this because, once i'd assigned key #1 to ftw and key #2 to arl, i started up using key #1 and then discovered i could not activate arl. not exactly the behavior i wanted or expected. i expected it to act as if i had toggled offline all the systems that i did not assign the quick key to, but that i could bring back online any system using the normal behavior. so, figuring i was missing part of the concept, i hit the books and found at the easy-to-read manual this very frightening note:

The scanner will remember the last startup configuration you used when you power up the scanner using just the power key.

Caution: If you press the wrong key when you press the power key to set your startup configuration, and that wrong key doesn't have any systems assigned to that key, you will startup your scanner with all systems locked out.Also, you can't cancel Startup Configuration, i.e. have your scanner startup with all systems unlocked they way they were before you used Startup Configuration.

and, sure enough, even when i started up with no keys held down, one of my two systems was locked out for use. oh god, says i, i've bricked my brand new radio. but i went back into my software and removed the quick keys from both systems, re-wrote the systems to the radio, and all seems back to normal.

for my use, i find multiple problems with this seemingly-very-useful-indeed feature, not the least is the fear that, as a new user of the radio you're going to have to start all over again with your programming and worst case do the factory reset to get it behaving again.

are any of you guys using this feature? is there a way around locking yourself out with a very awkward recovery?

thanks, /guy (73 de kg5vt)

i know this is an old thread, but i'm working my way through the messages and this seems to be the first one.

i read the same review and it concerned me enough that i only ordered a 4-pack of these 2400mah imedion batteries to start with. but i just now tried them in my new 396xt and they fit less tightly than the uniden supplied 2300mah cells. hot out of the charger they might be a little tighter but i'm no longer concerned and i plan to order more of these so i'll have 3 or 4 sets of them that i can rotate in and out of the maha charger.

6964. new feature: fire tone-out detection

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-09-25 21:51:13 UTC
From: gteague
Topic: 6964 Message: 6964

hi again. i really am working my way full speed on documentation and reading through the group messages and archives, but thought i'd see if someone could cut me a shortcut on this function that i could use right away.
here are the relevant ?talkgroups? from my local ?site? /?system? / ?group? (you can tell my trunking terminology is still somewhat suspect! arc says that my town, 'euless', is the group, so the below entries must be the talkgroup id's i guess):

* 10352 E-FIRE1
* 10384 E-FIRE2
* 10416 E-FIRE3
* 10448 E-FIRE4

so my question is how do i detect and set the fire tone out alert feature? will this procedure mean that i can do nothing else with the scanner either during the detection/setting phase or the actual monitoring for alerts mode?
i'm back to the documentation to find the answers, but any shortcuts anyone could provide would be much appreciated. hey, look on the bright side--i programmed my wx same fips without a single question! [g]
thanks,

Tone out does not work on trunked radio systems.

It works by monitoring a single frequency for the tones you program (it is an exclusive mode...you cannot scan at the same time). Basically it emulates a Minitor two-tone pager in this mode.

From: Paul Opitz
Topic: 6961 Message: 6966

For your application it would work better to assign Fort Worth to SQK 1 and Arlington to SQK 2 (SQK = System/site Quick Key) rather than using startup keys.

Subject: [BCD396XT] new feature startup quickkeys behavior?

in transitioning from the 396t to the 396xt, one of the new features is startup keys. and i tried it out my first day with the radio since i figured it was a natural for my use. i live in fort worth and work in arlington, so i figured that if i was going to work or coming home from work i'd startup with the arlington quick key, otherwise i'd startup with the ftw quick key.
but i ran into immediate problems with this because, once i'd assigned key #1 to ftw and key #2 to arl, i started up using key #1 and then discovered i could not activate arl. not exactly the behavior i wanted or expected. i expected it to act as if i had toggled offline all the systems that i did not assign the quick key to, but that i could bring back online any system using the normal behavior. so, figuring i was missing part of the concept, i hit the books and found at the easy-to-read manual this very frightening note:
The scanner will remember the last startup configuration you used when you power up the scanner using just the power key.
Caution: If you press the wrong key when you press the power key to set your startup configuration, and that wrong key doesn't have any systems assigned to that key, you will startup your scanner with all systems locked out.Also, you can't cancel Startup Configuration, i.e. have your scanner startup with all systems unlocked they way they were before you used Startup Configuration.
and, sure enough, even when i started up with no keys held down, one of my two systems was locked out for use. oh god, says i, i've bricked my brand new radio. but i went back into my software and removed the quick keys from both systems, re-wrote the systems to the radio, and all seems back to normal.
for my use, i find multiple problems with this seemingly-very-useful-indeed feature, not the least is the fear that, as a new user of the radio you're going to have to start all over again with your programming and worst case do the factory reset to get it behaving again.
are any of you guys using this feature? is there a way around locking yourself out with a very awkward recovery?
thanks, /guy (73 de kg5vt)

ah! well, you've saved me a deep timesink with that very clear explanation. no dropping down that rabbit hole for me. and yeah, i couldn't imagine any other way to detect the tones other than to park on a static fire freq and wait for a fire-i couldn't imagine how it would work with trunking and sure enough it doesn't.

thanks,

On this page:

http://info.uniden.com/twiki/pub/publish/keysandtheirfunctions.html

All but two of the links under "Key Functions in different operation modes" are broken.

Bob...

and, as it happens, i'm in dire need of that section right now. i was playing with virtual control in freescan and somehow got the damm thing scanning one system and doing a ham search. i don't know if it's doing a service search, one of the 1/2/3 quick programmed searches, or just a frequency search. in any case, i can't get the damm thing to stop searching! the uniden web page is very helpful on this topic, viz:

To start the search assigned to a Search Key, FUNCTION + tap that Search Key.

yeah, well how about how to STOP it! i never assigned any search yet, thus i don't even know which key to try to toggle on/off.

i'm beginning to realize why my 396t sat idle for 3 years--i lost the ability to use it due to hardly anything being intuitive enough to fix without a manual. don't feel bad uniden, the yaesu vx-nn series is just exactly as bad, necessitating that you carry two, 80-100 page quick guides just to operate it.

well, i'm completely stumped. i went into service search and tried starting a ham search and it starts, but there's no way to stop it that i can tell. i'm just going to completely reset the radio and reload it from one of my backups. geeeeeeeeeesh! i just can't believe i've been in radio for 45 years and built the very first pc from a kit and this little brick is completely destroying any dignity and geek cred i had left. [g]

one conclusion i've reached already is that if i can put the whole radio out of commission basically with one errant keystroke and can't recover, you could never use this thing in an emergency situation unless you are 100% up on every contingency and the use of every key and key combo available.

thanks paul! i know you know i work in arlington because i'm still using your very useful 'trinity blvd shortcut' to get there on weekdays! can't thank you enough for that one ...

yeah, i was envisioning being able to expand this feature so that i could do a startup key that would include (for example) arlington, cowboys stadium and ut which otherwise, being separate systems, would all need to be activated and deactivated manually.

the worst aspect of this brilliant scanner for me is my memory is going south with age and i just cannot keep more than a few systems with their associated groups in my head. i've tried various quick ref methods, but it's nearly as fast to scroll through the systems to find the group you want to activate as it is to break out the iphone and pull up a text file to look it up. i would investigate any methods anyone has to offer as to how to carry a map of your bandplan and access it quickly.

I could have done with this 25 years ago when we
used to use 2 tone pagers in this part of the
world. Nowadays, our paging is done using POCSAG on a dedicated frequency.

so, this has necessitated a re-boot in my thinking and put a dead stop to me setting up this radio. it's obvious that before i go one step further, i need to find some instructions on how to escape, reboot, reset, or otherwise easily get back to the configuration i started with given that it's so ridiculously easy to get into a wrong mode you can't easily exit from.

i ended up having to download a stored configuration back to the radio just in order to get it to stop scanning the ham bands. can't do that once i'm in my car--i'd just have to turn off the scanner and toss it into the glove compartment. and worse, i don't even know what my mistake was. perhaps i held the function key down for 1.5s instead of .5s when i was trying to disable group #2? i don't know--haven't the faintest idea.

thanks again paul. it's a lot of keystrokes to remember, i'm struggling
with all the modes and options.

and i found out which system torpedoed me the other day: fort worth trunked
public safety. it has 527 talkgroups, i'll have to prune that one.

[Non-text portions of this message have been removed]

6975. bcd125at features for bcd396xt?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-09-27 11:38:35 UTC
From: Guy Teague
Topic: 6975 Message: 6975

took my new 396xt out for its first road trip during shopping last night. i made sure i was only scanning euless and bedford off the tarrant county system to try to eliminate operator overload and dissertation. and of course i turned close call on although i didn't set it for close call only. unfortunately, i tried to set up the feature where close call hits would automatically store into some block of 100 memories instead of the 10 temp memories.

so i get to the gas station and a euless leo has a pickup pulled over and sure enough i get an 800mhz close call hit. the expected behavior was that if i didn't hit any keys, close call would store my hit somewhere which i could worry later about finding and then continue scanning. but it just stopped dead in its tracks apparently waiting for some sort of input.

at first i tried hitting 'e/yes' to store the freq, but then it wanted about a dozen parameters and i didn't want to mess with that--it wouldn't store anything anywhere without me entering something. so then i tried to get it to start scanning again with absolutely no luck. then i remembered paul's advice from yesterday to hit 'f+l/o', but that didn't work either, but just 'l/o' did. geeeeesh! meanwhile i'm sitting in a parking lot for 20 minutes to try to bring the scanner back to life, if i had been on hwy360 during the day the scanner would have just been a brick until i got to my destination.

another problem i noted was with the backlight. before i got this 396xt i decided to replace my 396t with the new 125at and i found that is an outstanding scanner for the money and i got familiar with operating it in just a few hours, but i missed having trunking, thus the 396xt. i noticed the 125at had a combination backlight option to activate on either a keypress or open squelch. the 396xt makes you choose and suffers in comparison. also, i need more options than 10s, 30s, or infinite. i'd like 5/10/20/30/40/60/infinite and there needs to be an option to keep backlight on until the squelch closes. i needed a backlight on keypresses and on open squelch last night.

anyway, when i got home i tried out the close call again and this time it didn't lock up like it did out on the road. but i could never find where it was supposed to be storing my hits. the best i could do was to tell it to store them to group 99, then set the delay to 10s so that i could start a scan and when it paused 10s on group 99 i could hold and then scroll through the hits. i like the method the 125at uses which is to store the hits in a 'c' group although even on that scanner i can't seem to go direct to that 'c' group, i usually goto channel 500 and then scroll into the 'c' group. i like being able to store more than 10 temporary hits, but someone has to tell me where the scanner is putting them and how i get there. and whether autostore actually works if you're not in cc only mode or autostore

mode, which latter only appears to be available via the menu system. how is autostore different from cc only--is it present because you can't autostore from cc only mode? will autostore be added to the 'f+hold off/dnd/pri' rotation?

anyway, too many questions, as always. just wondering if some of the excellent 125at features will work their way into the 396xt.

thanks,

/guy (73 de kg5vt)

I usually break Fort Worth TRS into several systems...putting actual Fort Worth TGIDs in one and different towns or areas of Tarrant County in others.

thanks again paul. it's a lot of keystrokes to remember, i'm struggling with all the modes and options.

and i found out which system torpedoed me the other day: fort worth trunked public safety. it has 527 talkgroups, i'll have to prune that one.

From: Uniden UPMan
Topic: 6975 Message: 6977

At the point where it was prompting for additonal input, you could have pressed SCAN to return to scanning (everything would have been stored w/default values).

F+L/O = Temporary Site/System/Search lockout
F+L/O, L/O = Permanent S/S/S lockout

L/O = Temporary channel lockout
L/O, L/O = Permanent channel lockout

The first hit you get with "Hits with Scans" turned on, the scanner creates a system named "Close Call Hits". That is where the hits go. This system is deleted when you cycle power.

When you pressed E/yes, you were telling the scanner to Quick Save the frequency into a permanent memory (doesn't go away on power cycle). That channel was stored into a system named "Qck Save Cnv Sys" (and is probably still there).

When you get a Close Call hit, you should either press FUNC (to display the frequency during the hit) or do nothing (the hit is still recorded and normal scanning resumes after the carrier drops).

Date: 2012-09-28 00:05:19 UTC
From: Guy Teague
Topic: 6975 Message: 6978

well, i'm pretty sure i waited for it to continue and it never did. sorry i can't remember any screens or keypresses since i was out in my car in the dark. i am sure i didn't have cc only or cc autostore set, i think it was cc pri. but i did want it to store to permanent vs temp memories and so i set all those options up. i think i misunderstood how the autostore worked (see below).

but i do have a question.the only way to get the automatically stored hits is to use the cc autostore mode, right? that's a close call only mode in that you can't do anything but close call, correct? and that mode is only different from cc only mode in that it stores to a user-defined amount of permanent memories created in a system created close call ?system? ?group?. anyway, i'lll give that mode a try later tonight, that might be exactly what i want if it'll do all that without user intervention but still give me a set delay where i had hit 'hold' and look at the data.

thanks,

/guy

6979. Re: [BCD396XT] Re: Static version of Twiki manual Was: out of space already?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-09-28 06:33:55 UTC
From: Guy Teague
Topic: 6953 Message: 6979

well, i did it yet again. i don't understand how i can so easily get that ham search going (it's not the default search, nor is it assigned to one of the 3 src keys) and not be able to stop it. i did the 'f+l/o', but everytime i do anything with the radio it comes back again. if i upload or download it comes back. and i don't understand why i have to lock it out. why can't i disable it or turn it off? lockout implies it is running all the time and i don't want it running at all unless i go into the menu and select it.

i received my scanner master documentation today of the book and quick reference card and of course they explain how to start all the searches but not a frigging word about how to stop 'em! is 'f+l/o' the only 'off' switch? i just turned the radio off and back on and sure enough, i'm still in ham search and the dammed thing is i have no idea how i started the search in the first place.

ok, i pressed 'hold' and then 'f+l/o' on the ham search. it displayed 'temporary lockout'. i don't want a 'lockout' of any kind, i want to turn off the dammed search until i specifically want it.

and of course, another power off/power on cycle and it's back again. so this time i hit hold plus the 'l/o' twice. and that locked out the frequency it was holding on. perhaps my mistake is hitting the 'hold' key. perhaps i have to turn off every other system first so i can make sure i'm operating on that search, let's try that:

and that only temporarily locks it out again.

ok another try. powered off, then on the radio. back in ham search. this time i did 'f+l/o+l/o' while it was searching and the radio responded 'locked out'. this time it seems to have stayed locked out.

so now i get brave and go into the menu and start a ham search from the search service menu. i hit 'f+l/o+l/o' and it tells me 'nothing locked'. arrrrrgggghhhh! it appears that simply hitting the 'scan' key puts it back in default scan mode and has stopped the service search, which is the exact behavior i've been expecting all along.

so how did i get it into the service search from hell mode that doesn't respond to the 'scan' key turning it off? and can you please come over with your soldering iron and burn out the part of the user i/o chip that allows me to do this so frequently by accident? [g]

thanks, /guy (73 de kg5vt)

Correct.

It stores conventional frequencies in the Close Call System / Found Frequencies Group. There is no option to look at the data in Close Call Autostore mode. It's fully automatic and stores as soon as the hit is found. Of course, you can always review the above System to see what was found.

Joe M.

What you want to do is FUNC then the lockout key *TWICE* (FUNC-L/O-L/O).

You are only temporarily deleting it from your scanning. That is why it
is coming back when you cycle power.

The manual describes several ways to stop searching with scanning. The
above is one method. Going into your scanner options and disabling
SEARCH WITH SCAN is another way.

dang, i _do_ remember reading about that when i was looking at the
differences between the 396t and the xt. if i remember right, that's a
feature the 396t doesn't have, which would explain why i never encountered
this problem up until now.

but why is this search acting differently from the normal service scan in
that hitting the 'scan' key doesn't dismiss it?

and i went through the menu system like 18 times and i can't find a global
setting to suppress search with scan. each service search has it's own
setting, viz:

menu // search for ... / edit service / ham radio / search with scan /
?lset ockout?

and i went through each service search and each one had the quickkey set to
'.' and the 'set lockout' toggle set to 'locked out'. of course, by then i
had locked out the ham search using the fn+l/o+l/o key sequence.

so the question remains, how did i get one of these searches started? it
sure can't be all that difficult as i've done it 3 times now under
different conditions. we've already determined that the same search started
from the menu item will quit when the 'scan' key is pressed. and none of
the searches had any of the quickkeys or number tags or anything assigned.
so it must have been the '.' key they are all set to. but i cannot for the
life of me get one started using any combination of function and that key.

well, i've cruised back and forth through my new $30 scannermaster book and my $8 quick reference card without learning much. there are at least 3 references to 'search with scan', but no information as to how you get into this mode. each service search can have a quick key assigned, but that is ridiculous on the face of it. unless you are in a certain mode or hit certain modifier keys, the quickkey is going to clash with the ones you have assigned to systems. unless these quickkeys are different quickkeys and only work in search mode. perhaps much of this stuff i'm reading is only applicable to search mode (which i don't use very much) and perhaps i'm looking at this all wrong. perhaps i am somehow accidentally ending up in search mode and i'm starting a scan by mistake, not the other way around.

now here is one that might apply from the quickref card:

*: to start a custom/service search using programmed search keys ...
*: /hold/ on any channel/freq and press /func/ + /search key/ assigned to search.

i can imagine me doing this, except that there were no quickkeys assigned to any of the searches. and then there is the matter of the 3 keys that can be assigned to 3 different searches. i've assigned bandplan to one of these, but i have no idea how to trigger it. evidently you have to be in some mode or other and hit some modifier key or other in some combination or other and how the hell would anyone other than a polymath with a (what used to be called) a photographic memory every remember this crap? i feel like i'm in wonderland and the mad hatter just ate the only map.

my opinion is that there need to be global options to turn off 90% of these features so that as you learn and become comfortable with one level of feature, you can gradually add them in. of course, i'm sure uniden help lines would be flooded with calls saying this or that feature doesn't work because the user forgot he turned it off. there's no winning this game.

From: MCH
Topic: 6953 Message: 6985

If you have SEARCH WITH SCAN enabled, it would still search it if you
hit the SCAN button.

Search with Scan is not a global setting - it's set for each search
category so you can activate only some searches.

How you enabled it? Who knows. The important thing is that you now know
how to enable and disable it.

If you want to use it sometimes, assign it a SQK that way you can
quickly enable or disable it.

Joe M.

They are the same SQKs, but there *are* 100 of them. Frankly, I could use 200 or even 300, but 100 should be more than enough for most people.

If I were to hazard a guess, and it's only a guess, I would suspect you had the function key enabled (it's sticky for about 3 seconds after you release it) and you hit one of the search keys (1, 2, or 3). I think ham radio was one of the pre-assigned search key items.

yes, that sticky function is giving me fits. when i want to disable groups i find myself either hitting f+1, f+2, f+3 or holding down the func key and hitting 1, then 2, then 3 instead of briefly pressing function, then hitting 123.

i did somewhat better on my first commute to work this evening. i had system 1 (home) and system 2 (work) enabled to start, then had no trouble dismissing sys1 when i drove out of the home jurisdiction. oh, and i had close call pri enabled and, since our discussion the other night, the expected behavior was that a close call hit would store to the temp 10 memories and would not scan those memories.

but i think i had some problem with that function key when i went to activate some groups under my work system. all of a sudden i got a blaring BHLAAAAAT! control channel out of the speaker and when i was able to take a look, the radio was scanning the close call 'system'. i thought that this system would only get created if you were doing the close call only mode or cc 'search and store', but evidently if you have the store memories allocated every close call mode will use them. well, unless i did something strange when i was fumbling with the function key to get those groups enabled.

in any case, showing i can learn something after all (g), i did a func+l/o+l/o when the close call system came up and got rid of it and was able to finish my commute. i'll investigate those setting more this evening. what i need to do is to devote a solid hour to just doing close call work using one of my transmitters and making my own notes as to how it works in the various modes before i try to troubleshoot on the fly out in 60mph bumper-to-bumper traffic.

thanks again,

ok, so further reading while idle at work last night. who else thinks i ought to drop everything else and investigate the new 'key safe mode' in order to protect me from myself and protect me from rendering my new scanner inop within 5 minutes of leaving the house? show of hands? ok, the ayes have it. although i won't guarantee that the beeps and 'no-access' displays won't frustrate me more than getting myself into some mode i can't get out of ... [g]

... and speaking of which, in what has become a very irritating pattern with all 396xt documentation, it is usually clear how to get into these modes, but _never_ clear and _always ambiguous as to how to get _out_ of them. from the easy guide, viz:

To turn Key-Safe mode on or off press and hold Func then turn on the scanner. The first time (only) you turn on the scanner in Key-Safe mode you will see 'Key Safe Mode On'.

by which i assume they mean that once you've put it into keysafe mode, it stays there until you again restart the radio with func+power and then the message would be (and i'm completely guessing here), 'key safe mode off'. but this is only a guess and not a very educated one at that considering my history of bad guesses on how to operate this thing. you'd never know i carried the 396t daily for years, i'm sure.

The WV Statewide Interoperability Radio Network
(SIRN) is indeed a Digital Trunking System.

It is an APCO P25 system which is digital. And yes, the Radio Reference link you posted also says it's digital.

OK, so despite the ever so clear warning about connecting the grounds on the earphone jack and the chassis ground, I did what any good ham would do to eliminate a ground-loop hum -- grounded the whole thing, including my audio hardware (yep, and the earphone jack) to a common ground.

Well now I've damaged the radio and cannot power it externally or charge the batteries through the radio. I think I may have damaged the voltage regulator.

When I hook up external power, it takes quite a long time to do anything, but eventually a message comes up that says "illegal voltage".

Obviously, something is amiss here.

Two questions:

1. Why is it wired that way? You might imagine someone would tie the grounds together.
2. What would the repair cost?

It is not uncommon to have a speaker that is not grounded on either side.

Why would you connect a point that is not ground to ground and expect it to work fine? (rhetorical question)

As to cost, you would have to ask Uniden.

Scott,

Can you power the radio up on Alkaline Batteries, no external power source?

Illegal Voltage means the source voltage your using is too high...

Note, however, that the preloaded system is several years old and may not still be accurate enough to actually work.

Yes, batteries work fine.

I'm pretty sure I tried it on the cigarette lighter adapter too with the same results.

If I didn't I should try that.

I should have mentioned that I did put the power supply on the multimeter, and it's putting out the appropriate voltage . . .

I realize you said it was a rhetorical question, but I had to respond here.

I guess I would connect it that way because it was my understanding that it IS ground.

Doesn't the black wire on a speaker indicate "ground" and the red, "signal"?

Apparently not . . .

Some lessons you learn the hard way . . .

I wish I was more informed about that sort of thing. It doesn't appear to be common knowledge . . .

Perhaps UPman could explain what I did and why I shouldn't do it.

If you will only accept an answer from UPMan, that is fine. But, I will tell you that you shorted one side of the speaker to ground and increased the load on the audio amp. Again, if you don't want to believe me that is fine.

I will let you know that many radios do not use speakers that are grounded on one side. It may not be common knowledge, but it should be. Never assume anything about radio design.

As for speakers, the colors can be anything the manufacturer puts in them. It's usually what is supplied by the speaker manufacturer (who has no idea what they are being connected to). I've seen black/red, two blacks, two whites, two greys, yellow/gray, Etc. Sometimes one side of the speaker was grounded. Often, it is not.

Why didn't you use a meter to check the voltages between the points you were connecting? (often if there is a voltage difference it's not a good idea to connect those points)

Here is one more common error that ill-informed people do: They connect the ground side of a mobile radio to the battery. NEVER do that. I had a competitor install a commercial two-way radio in a vehicle this way. The vehicle lost the ground between the chassis and the battery. Guess where ALL the starting current went; Right through the radio's ground wire which was the only path left. It literally fried the radio and they are lucky they didn't burn the vehicle up. Just another one of those things that should be common knowledge, but isn't. Some will say if you fuse that like, it makes it OK. It still isn't OK. Just connect the ground side of the radio to the chassis.

I know none of this does you any good at this point, but maybe it will help the next person. When in doubt, ask first. I'm pretty sure the manual does say to not ground the speaker.

7003. more operational mishaps ...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2012-10-08 05:53:47 UTC
From: gteague
Topic: 7003 Message: 7003

coming home from work 0600 still dark as always much traffic on hwy 360 even on a weekend and the road isn't that smooth so scanner is bouncing around somewhat in my crappy plastic iphone mount (another is on order) hanging off the windshield by its suction cup when i realize i forgot to turn the pd group on for the arlington system/site.
i'm scanning perhaps a half-dozen systems at the time and i realize that i'm not going to be able to catch the arlington system at just the right time to hit my 'func + 2' keys while it's on the screen. so what's the plan, i ask myself (it was a long 12 hours at work!) after i tried and failed to hit the '2' key while the system was onscreen and before the func key symbol went away.
then i had a bright idea. perhaps if i hold on the system, then hit func + 2 it will work. not a chance, even though after a couple of stabs at the hold key i got lucky and it stopped on arlington. as usual, my hitting func at the wrong time or in the wrong mode brought up some unwanted search and in general nearly got me lost.
did i mention that trying to do even this minimum amount of button pressing was perhaps 100% more dangerous than texting or talking on the cellphone which i am quick to yell at other people for doing? it was dark, my eyes are not the best--especially in low light--and i was having to hit the light button in-between other operations and the radio was bouncing up and down and the mount was bouncing up and down and sideways due to the roughness of the road.
(we'll talk later about how radio operators are not nearly as prone to accidents, but as our equipment increases in complexity, that won't hold up for much longer--only our tiny percent representation in traffic keeps us still under the radar, imo)
so what i did was disable all the other systems that were scanning (still possible because i'm still programming my systems and the systems i was scanning all are in the single-digit qkeys so far) until only the arlington system was scanning, then i hit my magick 'func + 2' key to finally get the pd into the game. of course by then i'd crossed over into grand prairie and the arlington system was no longer needed.
<insert wahwah sound here>
so the first thing i do when i get home is look up in some of the $90 worth of after-market documentation i've bought over the last week and find this:
To toggle Group quick keys on or off in another system press and hold Func to 'lock' Function mode. Scroll to the (enabled) system that contains the (enabled) group you want to turn on/off then press the corresponding number key(s). Press Func twice to 'unlock' Function mode and resume.
and actually, i had thought of doing this since i actually did know (had read) that i could hold the func key and scroll through the systems. but when you do that it looks exactly what it looked like when you pressed

hold on a system and that had been a disaster that had started up obscure searches i didn't want, so i figured that if the system was 'static' on the screen like it is when you scroll to it then it would react negatively to the func + 2 command as it did when that command was issued from hold.
but in any case, the biblical way of doing it listed above is, imho, way too dangerous to attempt in a car moving at very (in my case) high speed through traffic. especially with a handheld if you have to fumble around with dismounting it to be able to manipulate it two-handed in that way, although i feel uniquely qualified to drive in this manner ever since i learned to drive solely with my private part from the neapolitans when i was stationed in italy as they have to have both hands free of the wheel to express their opinion of everyone else's [bad] driving.
and i guess the lesson learned from this 'frogs wild ride' is to make sure you have every system and group you need activated before you start your car and if you need to de-activate a group while on the road, live with it until you can pull over.

Topic: 7003 Message: 7004

wow! so much for using the 'rich text editor', it scrambled up my post to a fare-thee-well. i assure you, it looked much much better on my screen when i hit the |send| key.

i just wanted to add that i mean no criticism of paul or uniden when i say i'm having trouble operating this scanner. i guess i make it sound like a big deal because i've been a 'gadget guy' all my life--people used to come to me to program their casio watches way back when 'cause i was the only one able to figure it out for nearly any model.

so, losing the battle over knowing how to operate a gadget is an anomaly for me, but the bcd396xt is not unique in that regard, although rare. for one example, the yaesu vx7r (which is still in a bag somewhere in my house--lost but not mourned-- and non-operational defeated me. there were too many disparate functions assigned to too few keys. and i wasn't alone, people started putting out users guides and i remember carrying one around in my shirt pocket that was 84 pages! and that was the 'quickref' guide! and it wasn't just me--this radio alone was famous for defeated seniors with weak eyes and failing memories such as me.

but the yaesu is just one of a handful of comparable radios--it's not like i _had_ to learn it or go without. i just picked up a kenwood th-f6a last week and although it's the first kenwood i've ever owned or used, i took one trip through the less-than-50-page manual and then did about 20 minutes of programming and i feel like i can understand and make use of about 90-95% of the capability of this radio despite it having nearly as many functions and features as the yaesu. the difference has to be in the philosophy of the user interface since the size and layout is essentially the same between the two radios with the exception of kenwood adding a handy 4-way 'mouse' button. and yaesu is not the only 'sinner' in this regards. some of the aor and icom models are not the easiest to use either, making kenwood's accomplishment all the more remarkable.

but the bcd396 is different in that it is a brilliant brilliant engineering accomplishment and up until perhaps a couple of years ago there's been nothing remotely close to compare it to or to go buy if you couldn't deal with the uniden. and i haven't seen any of the gre or ratshack scanners, but ratshack has a long and deep reputation for having some of the most user-unfriendly and buggy user-interfaces going. i have never been truly happy with anything whatsoever i've purchased from them--it's nearly always been a case of needing something too badly and they happen to have it. but, i take that back. my radioshack race and 800mhz antennas are outstanding. but i've bought hundreds of feet of bad rg58 and pl259 connectors from them. anyway, i digress ... .

so i keep hammering away at the 396t and xt because they are brilliant. but i think it's apparent that i'm one of the ones that just can't grok the paradigm of any logic the user commands represent. i have a digital audio recorder which is much the same with about 4 functions for each key depending on how, how much, and when and what mode you press the key. but an audio recorder has an order-of-magnitude less functions and operations than this scanner and it's manageable though irritating and necessitates repeat visits to the manual to bump the memory.
